4/1. After a windless morning, I got up to  
urge to go and do something. Sorted out barrels  
& up to Vega bar. Flipped up to Mega Hill  
Shut, carrying the preceding three days of clothes.  
Left Lagger, Big Nose, Ian Hobbly, Alan and  
arguing about safe belays, and Joe, Steve and  
Colin set off up hill. Up past fenced shatts, about  
and into open to north. When Colin found an entrance  
leading into a phreatic zone, all about walking  
over set of down a passage about steeply rising  
with leading straight. Thinking last found GLORY, but  
not a be in mind. 30m or passage emerged from  
near the hills, explaining the straight. Came  
up the hill, towards a beech tree that  
growing, with a bare limestone lip on the descent.  
The bottom was, as anticipated, of no interest.  
There were several interesting holes on E side. Steve  
found a shaft, the ladder was in layers from top  
down. A layer was for above in the day. Water can  
be at bottom approx 30' deep. The rocky side was  
making so hot that the sun was not seen at  
all. A look at nearly tight light and  
on some draught.

(Continued)

(4)

# LECA MOLL SHAFT

Descended shaft with intention of pushing a surveying  
rod new shaft to a depth of 18mtrs checked with  
ge blocks. A second short shaft nearer ent also  
checked at -10mtrs. A climb across the top of the 18mtr  
shaft led to larger passage on fault, holes in  
or have estimated depth of 30mtrs small stream  
from anen near boulder floored chamber some  
sages not pushed and none of shafts were  
descended 50mtrs of largish passage found all the  
cave was surveyed including pending two  
undescended shafts see sketch at back.  
Loose pitch descended - didn't go  
about 80' deep - Luger, Andy, Alan, Big Al

(5)

Near last pit,

(Continued from page 3) Colin found a large entrance  
x 20 ft high x 40' wide with descending passage. Followed  
this until could see no further (no light). The inward  
passage descends over boulders. Noticed strong inward  
draught. Descended to chamber with high arched and  
water dripping in. Continued along pebbly crawl until  
noticed climbing up again, passage becoming rift-like  
and becoming an obvious inlet. Noticed that the draught  
was lost, then faint bootprints — blast, not the first  
here! Back at the lowest point again, re-encountered  
the draught. A sort of chessy-hole in the floor was  
taking a fair draught; could be felt on the hand.  
Obviously wants digging.

Up hill again, to look for walled up cave found by  
Colin last year ✓ <sup>424</sup> ~~Found it, but wasn't anything.~~ ✓ ?  
retraced steps down hill, looking at various  
holes, but found nothing not already known  
from subsequent conversation with Pedro.

(1)

4. Up road along La Vega, dropped off opposite Peña's  
arrived - walked off down Mega hill. Joe, Pedro,  
John S. and Colin up dry valley on N side of La Vega  
to look at shift found by Pedro other day. First  
looked at rift entrance in dry valley, in tree. Joints  
p inside with bottom of small shaft, with inward draught  
dropped to fairly immature Dolos-like passage. Progress  
stopped by a pack-knife bend. Either a lump hammered  
or a dig in the (loose) floor would yield progress. Left  
for another day. Then, five minutes back down the  
dry valley to a clean shaft in nice, white limestone. <sup>INTERNA</sup>  
Shaft about 30' deep to descending rift with lot of loose  
boulders. Dropped into heading rift at right angles  
and straight to the top of a pitch. Looked very Dolos-  
like, and seemed deep - 60', probably. Another  
next to it seemed deeper, perhaps 80' plus.  
Left this for another day, and retraced out.  
Then, over hill slightly to large snakehole, again in trees.  
steeply descending passage, marked by skeleton of animal  
perhaps a young goat - but otherwise very dry. Progress  
stopped by a choked area. Lot of very narrow rifts,  
but not really passable. Pedro noticed a choked way  
in into a possible chamber, but digging needed. No  
noticeable draught in this one. On way down hill

7  
barrage towards the sea, a small creek runs out of the  
slope of the hillside, with a very draught. The  
Factor too small to descend without extensive digging. A  
\* ch. 3 nearly was suspected to connect, and the descent  
but the shaft was choked 15' down. Several depots  
investigated on way down, but nothing of any interest.

## (TORCA DE LA LASTRILLA)

Pedro, Joe, Colin, John S., Ian Nobby up La Vega.  
rpped it again. Up to second shaft investigated  
today. The "60'" shaft turned out to be "35",  
was descended after two bolts had been put in  
top. (Rock very shattered on one side of fault, and  
natural belays). Next was 20' pitch rigged as continuation  
first, then steeply-sloping boulder field side, to  
another 15', needing a short ladder, descending further  
on of this yielded the top of a estimated 100' pitch.  
k of tackle halted progress at this point. On way  
Joe noticed passage up above 100' pitch, with dark  
at end. Pedro climbed up, the climb being up  
shat cascade, and exclaimed that he couldn't see  
thing - his carbide lamp wouldn't light up the walls,  
e followed, and a very large chamber was seen,  
the entrance fairly near the rock. Hanging stones  
called a deep hole in front of the edge of the  
edge slope on which they were sitting\*, a boulder  
p. further into the chamber, then, across the other  
e, a further shaft down to unknown depths. After  
ing in awe at this spectacle for at least 20 minutes,  
parly retreated, leaving the place rigged for further  
stigation. Pedro discovered the area was called  
strilla, hence the name for the place - Torca de La  
led "this point" Minshel's Gallery" Lastrilla.

6  
14 Mega Mall Finished at last.

Big man, Alan; Luggar, Andy & Big Bob  
Luggar & Alan finished the survey  
Several shafts descended a 50' - 70'  
none of them doing anything at all  
Steve used up his 6th life by  
falling off a ladder above an  
80' pitch, without a line.  
Unfortunately he got jammed  
and fell no further than 10'

Three undescended shafts requires a further trip in the  
summer

April 183

A big team, Colin, Joe, Pedro; Han, And  
 ugger, Jan and Big Bob went back  
 Torca de la Castilla, Went down  
 our mentioned shaft - 170' - leads to  
 a series of lifts descending a  
 further 80' but getting too tight  
 Back in the big chamber a ladder  
 as dropped from the ledge to the floor  
 about 60' in all the first but when  
 we started off down a ramp  
 about 30' square which got a bit  
 top. ~~As~~ Seems very promising.

4  
8/4/1983

Caena Ladrill

Joe, Colin, Ligger, Alan, Pete, Steve, Andy, Blaz,  
 Above mentioned group was descended sliding in  
 a pitch to a muddy floored chamber with  
~~obvious~~ way on. Draught seems to be coming  
 down an oven and going up the ramp. This  
 is strange as at the top of the ramp  
 draught is going down. A good look round  
 and a couple of heavy traverses pro-  
 vide signs of where the draught goes.  
 There are still a couple of possibilities for  
 the minstrels gallery. Bolts & a lack of  
 main cells are needed here. Detachable

TRAVERSE ROUND LEFT WALL OF MINSTRELS GALLERY BRINGS ONE TO PASSAGE  
 WITH FLOOR OF LOOSE BLOCKS WHICH QUICKLY CHORE UNDESCENDED PITCH  
 REQUIRES CROW BAR CONTINUING TRAVERSE REQUIRES PROTECTION COULD  
 REACH A FURTHER PROMISING LOOKING PASSAGE.

La Vega

4-83 Dred Vestiges - Steen Ventin - Perreys  
 The intention was for Steve to drive the pump supposedly 100'  
 the saw. Deck went in first for 7' and decided that  
 Larry would be a bit hard so Steve went up to survey  
 a quick note. At the pump which was near 300' in Steve  
 felt that the vis was poor and he only had a single bang  
 he huffed out. Water could be heard through small stat.  
 stem so it could be only a short duct. I would  
 it a mini bottle only would be needed. A quick return  
 of the kit was made and a soft beer was had at  
 a Hemmer

10/4/83 - Steve, Andy + I to the end of the passage in cotton. Descended 60' pitch followed by 40' sharp rift. Further 25' pitch follows after a squeeze. Another ladder down leads to a large chamber ~~which~~ draught is going up a low passage which needed a bit of digging. This terminates where a ramp leads to 2 small holes into larger passage. These draught in like buggery but are very awkward - so far impossible to pass.

There is also an unlooked at inlet to the new chamber and possibility of passage above the 60' pitch. Acrobatics & climbing aids needed here. Left Frank's pass tackled up for a further trip tomorrow.

After some festering & bugging about, team went  
 to Vega bar and took tackle for Coteran up hill. Most  
 continued up hill, looking for possible further entrance  
 Coteran/ Renada. Ian found a large-ish phreatic  
 entrance about 200 ft above Coteran, with a possible  
 outlet out, but with no lights, could not be looked at.  
 up hill towards a barn. Looked at a few holes but  
 nothing remarkable. In a large shakehole found a rift  
 entrance strongly draughting out. Further on, in an area  
 of pinnacle karst, found total of 5 shafts, all about  
 10' deep. On way down, found a strange small hole  
 which although emitting no noticeable draught, had a  
 large faint roaring noise inside. Colin rediscovered  
 shaft mentioned in Quadernos, Joe rediscovered  
 De Frades. On cutting down the hillside towards the  
 bar, Joe discovered a small resurgence with a hands-  
 on - knees crawl. At the bottom of the hill a small  
 resurgence was noticed and near it a crawl with no  
 noticeable draught.

10/4 Joe, Colin, Ian and John S up to draughting cave found yesterday. Discovered behind the draught not-existent today. A ~~wide~~ rift sloped down, leading to a climb down into a chamber with a high area, and a crawl under into a lower chamber again a high area. In the upper chamber some crawls were followed ~~where a draughted hole was found to come from~~ <sup>which</sup> but the crawls became too tight. In the lower chamber the draught was found to disappear off down a 6" wide rift which looked tantalising and might go with a lump hammer. A 5" diameter plastic hole in the wall of the chamber also took a strong draught. Colin found a climb down a hanging rift which led out onto a balcony part way up the wall of the chamber and also broke out about 20' from the floor. Surveyed the cave, provisionally called ~~But Shit Cave (BSC)~~ Noticed on the way out that the cave was draughting inwards, but very dependent on the wind outside. Then looked at shafts in the pinnacle karst. Ian descended one under a bench which was 15m deep and choked. Joe descended one which dropped from the back corner of the shale, which was 18m deep (to surface) and blind. Ian SRT'd one (after Joe dropped a

climb down it but that: another ~~story~~ story). with a  
 ad tree across it, which turned out to be 70' deep  
 in a fine rift, with about 40' of rift passage  
 the bottom. Then ran out of time to look at others.

4/83 Luyar + Han went to Below World  
 Cteron. 200m unurveyed passage was surveyed  
 rift passage opposite also surveyed. Rift passage  
 2 draughting pitches requiring a ladder there  
 ably join it lower level. Other passage has  
 ascending ramps, requiring a rope to get to top  
 of descending rafter can hear water and a  
 echo - possibly a near Edge of Universe.  
 1st ramp (ascending) rift type passage left  
 ahead. First major rift hand found in Between  
 1st passage looked at ends in two draughting  
 pitches about 80' underscanted.

70 MTR SURVEYED

on left  
 or passage near entrance half way down slope a 8m  
 imp up loose calcite only ended in a phreatic pocket  
 behind a large boss.

① Descended?

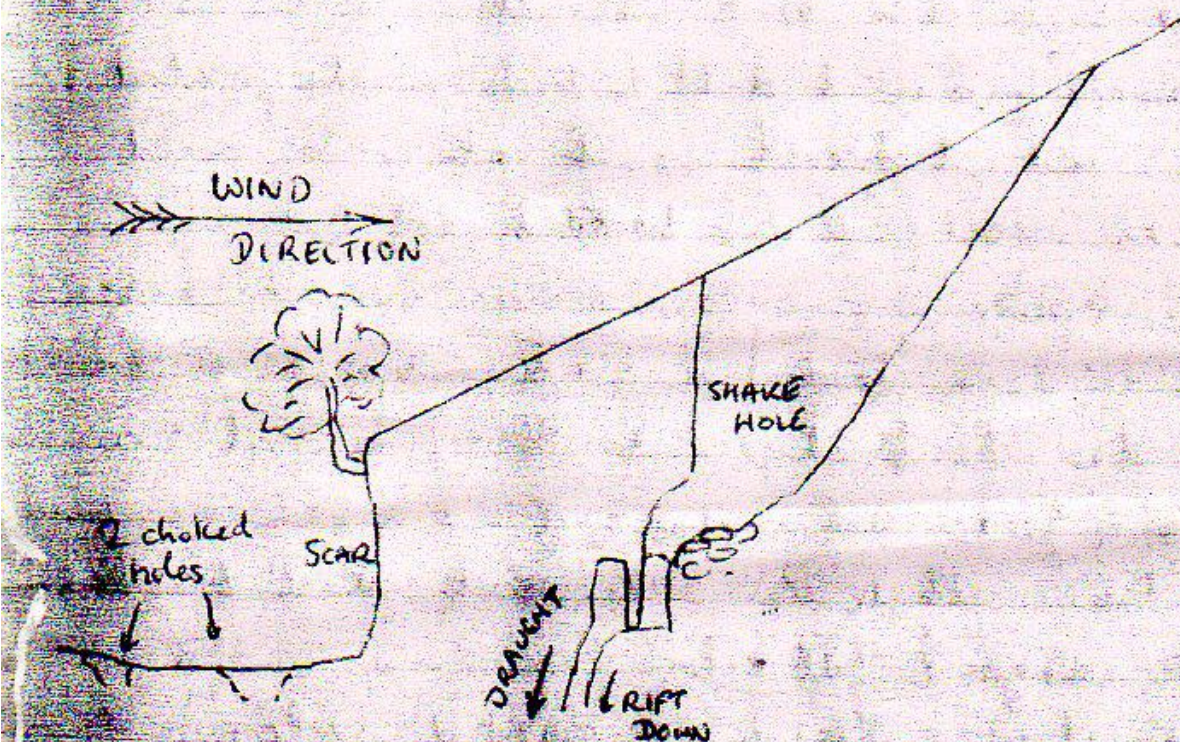

11/4 All to La Vega bar. Lizzar, Andy & I to Coker. Derek, John S. Big N and Colin started looking at the crown of the hill (page 14). Joe and Ian up hill to Sima de la Cabañilla - the chert from Cuadernos (again, page 14 <sup>(NO)</sup> 37) Due to lack of ladder all down Cokerons - the pitch rigged for SRT, 2 being put in at the top, which resembles the battlement of a castle. The pitch is 25m deep (supposedly) and rather impressive. Ian went down and explored all passage at bottom. This pot was full of fine formations and gourd pools. One interesting find was a skeleton of a dog or goat in one of the passages with RIP inscribed on the wall above with a carbide flame. Following passage on ~~left~~ <sup>right</sup> from entrance pitch led to a calcite barrier which was smashed with a hammer and led to about 60m. An unsurveyed phreatic passage. A small hole in mud against the wall had a hand-drawn draught and was dug by hand a possible dig. A return to entrance pitch was made and using SRT. net for an escape and back to Vega Bar. Cabañilla needs surveying in the drought.

Whilst Ian was underground Joe looked at a few holes nearby and had a general look round. On the way back to no 37 he noticed a hole nearby which is only visible from above. A short choked shaft was visible, just behind a small scar which is a prominent feature of the "cwm" here. Thinking it was merely a remnant of a cave through into the scar, Joe nearly didn't bother with it. However it was descended, and a short bit of passage noticed at the bottom. A roaring noise could be heard, and to his surprise Joe realised it was a draught, and inwards at that. The passage, about  $1.5\text{m} \times 0.5\text{m}$ , went about 3m then doubled back on itself, then closed down to a critical rift. Stones dropped down some distance to stop with a dull thud into the floor of a large-ish sounding chamber. The draught was roaring down here, but it looked too light. Once Ian had come back up Cabra-killa, he had a look at the new find. He managed to squeeze down the rift "a bit like Pippikin" and into a large rift passage beneath. He stopped at a large chockstone about 5m above the floor of the passage, progress being halted by lack

of the means of getting back up. He successfully managed to get up the squeeze and it was notice that the draught fluctuated with the wind outside. At its strongest it was like being in a wind tunnel but the direction of the draught was against the wind it would be expected if induced by the wind out.

Called it Hidden Cave

(576)

Cueva Elena

Derek Westwood, John Stott, Big Steve and Colin looked at the small cave near the resurgence at the foot of the slope up to Estacion noted the previous day (see p. 14).

The cave entrance faced directly into the hillside but the passage then bent immediately to the left (east) after approximately 2m it doubled back on itself, started to descend and tightened up. A continuation could be seen to the left (into the hillside) but was impassably tight.

DEREK our team leader took the trenching tool and did the first shift at the face. After a good stint, John took over and continued downward by the time these two stalwarts had finished there was a good 100 kilos of mud and stones stockpiled at the head of the tight section.

Big Steve then took over and was able to look around a corner along a section with a higher section (rift in the roof) to a small boulder set in mud and blocking the way to continuing passage. The mud around was loosened and the boulder found to be readily movable. Colin then took over and felt that the boulder could be

moved with the feet more easily than the heads, went in again feet first and pushed the boulder and a second into more spacious passage beyond. Colin felt that it would be easier to dig floor of low bedding to left of the start of the tight section & to follow the section with the higher roof around the tight corner. This was quickly dug out and the first squeeze passed.

After a short interlude during which Comediantes was limited (see overleaf) Colin returned to attack a second squeeze about 2m beyond the first. This was part mud and part solid rock/stal ~~covered~~ floor. Squeeze of full body (approx 2m) length. Digging mud out of the floor made the squeeze more ready but left dumps of rock uncomfortably close to the roof. A short cross rift about 0.5m wide, closing to left and right followed and squeeze continued with mud floor to slightly larger section where it was possible to do a form of tumble, turn so as to return head first. Beyond this point the passage split into minute holes with no prospects for extension. Mud floor thoroughly wet & slippery beyond 1st enlarger. Altogether on p. - - - - e. - - -. The return trip of 15 net took a good 10-15 minutes.

Comediante.

Between digging 1<sup>st</sup> & 2<sup>nd</sup> squeezes in Cueva Elena, Deres  
Big Steve & Colin visited Comediante. Looked at all  
three entrances and visited the sump pool (rising)  
which looked beautifully clear. Then looked at  
the remainder of the cave and eventually got  
bored and came out. Deres carbide light  
exploded, and he was then seen looking for  
somewhere to evacuate his bowels, which he duly  
did.

Colin

Joe ~~and~~ and Ian went up to have a second look at Hidden Cave, armed with some tackle and Derek's brand new lump hammer and chisel. Joe walked up to the small scar, and on a sudden impulse looked to see if Hidden Cave came out on the face of the scar. He could have kicked himself when he saw a narrow ~~slot~~ slot, slap-bang in the middle of the scar, at head height, concealed behind a rib of rock. The slot had a big black hole behind it and on being given the usual Boo! gave back a lovely big echo. Ian and Colin went down Hidden Cave whilst Joe banged at the entrance of the slot but couldn't hear him, so the conclusion was that there was no direct connection. At Hidden Cave a belay and ladder was hung down the pitch <sup>rib of limestone</sup> just above the chockstone <sup>down</sup> descended into passage about 15 ft long with a pitch which when passer dropped seemed at least ~~30~~ 30 m. deep, with howling wind. Fortunately the head of pitch is so tight and needs some hammer to pass it. An old percheron passage ~~on~~ on left of pitch was descended down to a boulder choke with no connection.

to pitch noticed. On climbing ladder out again an alcove was found in wall ~~with~~ a dripping roof ~~and~~ and pitch of about 10ft with a pool of water at bottom which sounded dead so was not descended. Continued up pitch and passed ladder to Colin and struggled up through squeeze and out.

A faint tapping of ~~Jo's~~ <sup>Derek's</sup> hammer could just be heard inside.

It was decided to have a proper go at enlarging the slot in the scar, using Derek's hammer and chisel. The rib of rock was very satisfyingly removed after which the work got more tedious and slow. Colin and I decided to go down Cabratilla and have a dig, whilst Joe continued hammering at the slot. The work was very awkward the rock hard and there was the constant danger of dropping either or both the hammer and chisel down the shaft beneath. Joe gave up as it was going dark, concluding that this was a long-term project for someone in the summer. However, the hole draughts strongly upwards, and stones drop an estimated 30m down in two stages.

26

Colin and Ian walked up to Lebratle  
Ian rigged pitch up with ladders (which  
turned out to be about 90') so Colin could  
ascend, while Ian SRT'd, we made our way  
to the dig which was not draughting  
much as before, and took it in turns to  
dig, after about 30 mins it was decided to  
abandon the dig upon hitting calcite.  
Colin pushed a small side passage but  
just led to a closed phreatic pocket. We  
made our way out back to the Vega  
w.

It was decided to call the slot in the scar  
Ammered 'Ole' - what else could it be called?

13/4 Everyone feeling slothful. Baker's bar got in the way, making electric company men SRT'ing up the concrete poles in the sun. Eventually to Vega bar. Joe, Ian and Colin up to 'Ammered'ole whereupon Colin continued hammering at the offending slot, whilst Ian debatched Cabrahilla. Joe collected his gear and walked over to Coteron. After a while some figures emerged from the Vega bar and eventually Big Nose, Luggie, Steve and Alan appeared up the hill. Alan stayed at the top to lifeline, the rest descended, Joe not finding it a too pleasant experience, after years of not climbing big pitches. Joe and Big Nose did a quick tourist trip round the areas accessible above the 2nd pitch. Luggie looked at pitch 3m deep just below the entrance climb choked with talute slight draught out of small hole. A awkward climb into hoped for passage was completed on left hand wall of passage with gours leading from entrance opposite major passage ending in choke. This just led to a series of phreatic pockets after 20 MTR 70° ramp.

Cotteran, Luggar, Andy. Went to  
 and get someone through the hole  
 the end of Franks pass found on  
 1/4. Were diverted by the discovery of  
 a new passage of 250 m of passage leading  
 to Franks pass about 70 m before the  
 pitch. This new stuff "Matutano  
 passage" is mainly low but draught  
 all. Ends in a pitch ~~into~~ which looks  
 like big stuff.

After this minor disruption we  
 continued to the end of Franks and  
 merged the stuff found yesterday.  
 Luggar had a quick go at the  
 lighting hole but couldn't get there.  
 was too late to start a sustained  
 summer and chisel job (but will be  
 all worth it in the summer)  
 tackled Franks passage on way out

2/4. ~~Steve~~ Cotevau; - Steve, logger, Alan & Renada arm surveying - SURVEYED 130 ft of passage in Renada arm just before edge of the <sup>onward turn of</sup> ~~water~~ two passages one on either side of main drag right branch ends in low choke no draught although small upward tube 20/0 mms in draught stronger other passage proved to be an oxbow joining with passage already partly surveyed. rejoined the rest in Matutano passage where a handkerchief was used for aid.

Meanwhile C & Andy went back to pitch at the end of Matutano passage expecting nothing less than a couple of k of stumper and mucho glory. Descended the pitch in blind fuckin' chamber. Others caught up at this stage. C, Andy & Alan got out of the cave Steve & logger went looking at boulder choke at the end of the Renada arm - - - made good time to end of Renada arm and found surveyed passage leading round part of the choke ending in the 80 pitches all left

end wall and floor is composed of large blocks.  
 or Arenas were climbed ~~the~~ on the left in this  
 section the first for 12 mtrs one wall composed of  
 rocks short passage led of on right ended in sand  
 the second aren nearer pitch ascended for 20 mtrs  
 cross rift again with with one wall composed of  
 the aren continues so does blocks gets too  
 dangerous boulder shake must have a vertical  
 tent of at least 40 mtrs? on way back to first  
 section of choke scene looked at maze of passage  
 floor footprint, noted but passage not surveyed  
 to pushed to any conclusion requires more attention  
 same time logger looked at some roof passage.  
 surveyed ended up looking down through roof  
 main passage with tube passage 3 mtrs ☐ continuing  
 other side requires a rope to enter as traverse  
 and is loose. This section of cave require a high  
 le survey plan and elevation from ST 72. to find  
 a promising route through choke.

B/4 (Contd) After virtually hauling Joe out of Cateron the party was informed by Colin that his efforts on 'Ammered 'Ole had yielded a slot big enough to get through. Accordingly, Big Nose and Joe accompanied him over to the entrance. Just before it, Joe stumbled across yet another ~~one~~ previously un-noticed shaft, at the same contour as 'Ammered 'Ole, ~~but~~ and directly downhill from Cabrailla. The entrance was fairly small, and concealed by a big lump of limestone. Anyway, attention was focussed on 'Ammered 'Ole. Big Nose had a go at getting through, but it still didn't look very big, and was just getting stuck when Lugges appeared on the horizon, over from Cateron. ~~He then started~~ Lugges started shouting about a great big open shaft he'd seen, and eventually came across just as Big Nose had extricated himself from the slot. The shaft was about 40 ft deep and belled out inside into a chamber. Anyway, Lugges then had a go at getting through 'Ammered 'Ole - without a lifeline - and proceeded to get very stuck. He actually appeared to be getting worried, and only got out by dropping his pants which were jamming him in. Again, 'Ammered 'Ole

as left for another time. Though everyone  
 agreed it looked very promising and was still  
 roughing on, even though it was very still outside  
 the shaft previously found by Joe was then  
 promptly rediscovered by Luger on the way  
 back across towards Coteron. The limestone  
 lump was rolled away and lugger went down  
 shaft about 30 ft deep.

### TORCA DE LIMESTONE LUMP

1 MTR deep ladder pitch to floor of ~~island~~  
 block wedged in rift further 5 MTR ladder drop  
 over wedged block to small chamber a couple of  
 loose blocks at top of short downward squeeze  
 required 4 MTRs hands and knees passage to sharp  
 corner section leading into small over chamber with  
 rips coming in from roof, 3 MTR climb down
