MATIENZO CAVES PROJECT

LOGBOOK

Year: 1992

Season: summer

Logbook pages scanned to jpg then combined into a pdf file using http://smallpdf.com/

Juan Corrin, January 2015

1992 This is the year of spain the locals have kindly laid on Exop the Olympics and Columbus's bash as sick shows for this years Matienzo Exepid.

21/7/92 Rioano ANDY G ANDY P Richard Blake.

Purpose of trip to survey entrance to upstream/downstream junction. In to jyetion & then down stream to show Andy G & Richard but only stream way. Surveyed out. Ladder & rope left in on on Pete climbdown is' pitch.

AGP 

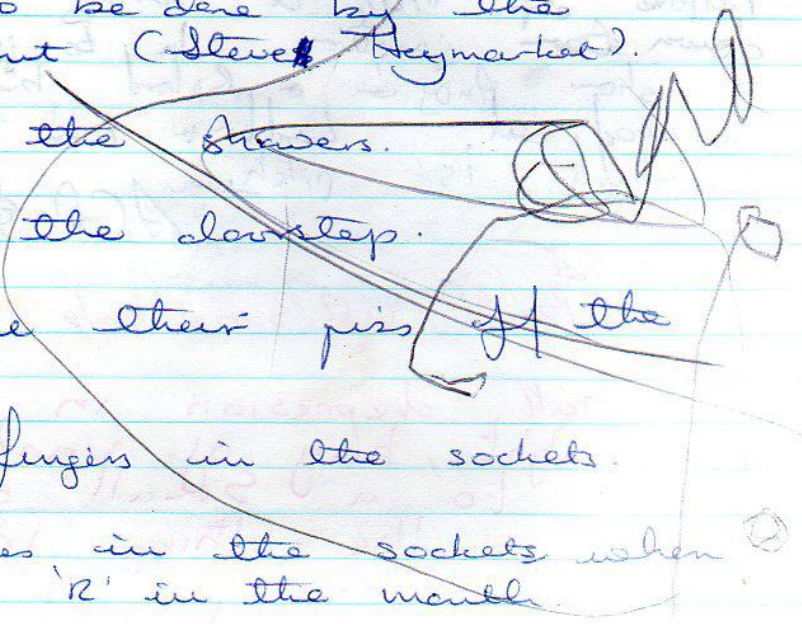

22.7.92
RB/AP/ with some help from A.G.

Small depresion in Juan's back garden no draught, bag of yank, no obvious way on due to a small amount of water. So filled the thing in with crap & Cerveza bottles with a wee bit of sweeat. The things we have to do for drinking tokens. Wheres the Paddy's when you need them.

For AG Read BB

Rules for the Toilet Block. Version 1.1

1. No reading sanitary towels.
2. Mixed showers only.
3. Only fruity + knobbly condoms.
4. All cleaning to be done by the Camp Commandant (Steve* Heymarket).
5. No shitting in the showers.
6. No wanking on the doorstep.
7. Men must wipe their piss off the toilet seat.
8. Only stick dry fingers in the sockets.
9. Stick wet willies in the sockets when there isn't an 'R' in the month.
10. "Actually I'll have a Pacharan"
11. No cars in the shower (except 2CVs)
12.

* escape committee meets 2nd Wednesday in the month when [illegible]

23/07/99.

✓ ANDY G TRANSPORT.

RB/AP/AG/G?

Trip to plummet / descend 319,320, 174,175, Total amount of cave explored: Sod all. Reason, Amalgamated Navigational Union of Speleologists got truely fucked up yet again.

Started of with driving up the wrong track, stopped when track somped in cow shit.

Wandered up right valley (wave!)

Decidede on checking out the correct depresions (Mega wow)

Didn't find correct shafts (what the hell do you expect?)

Decided was wrong area (suprise suprise)

Imagended a contour line down the valley maybe the one (bet your life Graham?)

fucked up - [redacted] went home!!!

BOUGHT RB LOTS OF BOOZE (THE THINGS WE DO TO KEEP HIM ON THE SURFACE!!)

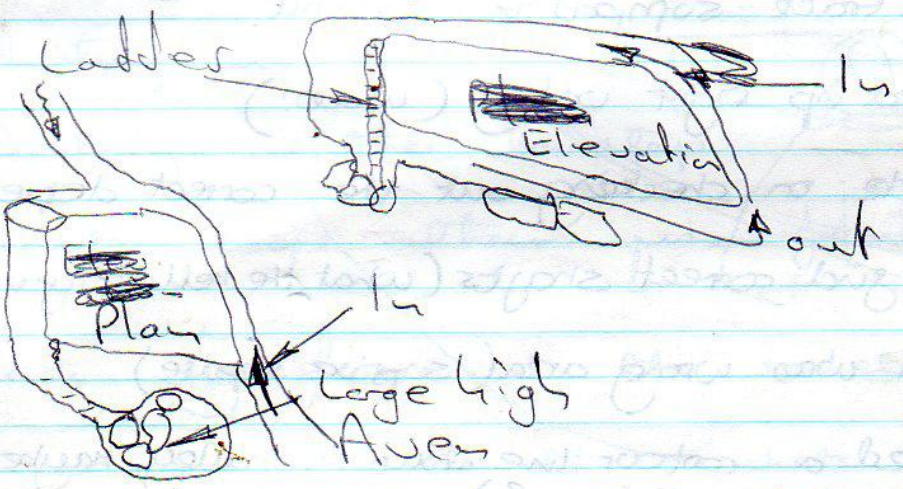

24/07/

QUOTES: CAN'T GO CAVING, MY MOTHERS HERE!!!
OH SHIT, MORE SOGGY SOMMERS,
SARAHS VIRGIN PASSAGE??
SNACKET REQUIRES AN AIRBAG.
NO HONKING IN THE BOG (JOAN)
DOS QUINTETS? etc etc
ANDY PRINGLES GOING TO HAVE A SHOWER
PISTI. two in one day and still not clean Stball.

Alpine Cloagh (099) 23-July 92

Steve O Peter T Eagar.

Rigged all the way to Easter limit widening the head of the third pitch slightly. (No bats were seen unlike Easter) Head of undescended ladder pitch was very muddy, the pitch was a bit disappointing but had a draught.

The ladder pitch choked with boulders, but it was possible to pass under large block 30ft dicky (approx) and climb back up to head of ladder pitch.

It was possible to climb up a narrow draughty rift and force away up through the boulders into a high Aven with very large blocks above.

Other leads looked at require digging but with out a draught they seem doubtfull. Retraced back to entrance shaft and two large undescended craters.

Surface Note

Two Shelter type entrances were found plus a shaft marked (M3) at the head of a large fault.

Nos needed ?

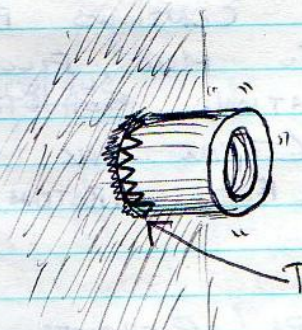

RTE

9/10 Good

24th July 1992 892.

Pete E, Steve O, Eleanor and Sarah.

Saturday start at 1:00pm with a lift upto the head of the Mostajo valley to clear out 892 which had been described as somewhat bouldery. Whilst Sarah & Eleanor completed the surface survey Pete & Steve descended the entrance pitch. Basically bolted and de-bouldered all climbs and pitches upto the 4th pitch. Climb at base of 2nd pitch is now descended on the left using bolts for a handline / traverse line. Beware the 3rd pitch is directly below the bottom of the handline climb. Considerable time was spent clearing the 3rd pitch as the bodies was causing boulders to move much to our annoyance. "High TENSION" However much fun was had clearing them plus the pitch is now approximately 1 boulder height shorter!!. Below this pitch is a climb up over boulders into a rift - ~~[illegible]~~ to the next pitch, as yet undescended.
Oh yes, rebolted entrance pitch, for reasons below

"Dead sage says Pete Smith!!"

LEFT BB ALONE WITH ? (THE THINGS WE DO TO KEEP HIM OUT SURFACE!)

Steve O (Camp Commandant).

Scene Late in the bar!! Act One
Cast Steve 'O', Eleanor, A-N ~~[illegible]~~
Steve O':- Shit has he got on with??
Entire contents of the bar:- Put it in the book (whats sarah doing in the middle). ME Innocent by stander.

24/7/92. Concebo. No change since Joes last visit. No drought — no go.

Andy Q, Julie, Jason, Penny, Jon, Marge, Carolina

FRIDAY + SATURDAY RICH ANDY P PETE

FRESNEDO II

TWO TRIPS WRITTEN UP IN ONE. PURPOSE OF BOTH TO TIE UP LOOSE ENDS BEFORE TORY GETS HERE FOR THE BIGGIE. LADDER DROPED FROM SURVEY STATION — INTO RIFT. TO THE LEFT LEAD UP TO 10' [redacted] (OVER 2m) DROP IN TO STREAM WAY. TOO TIGHT EACH WAY. BEFORE THAT TOO THE RIGHT WAS CLIMB UP IN TO WALKING PASSAGE FOR 40 ISH M. (THAT METRIC!) climb up to [illegible] TOO THE LEFT SMALL HOLE LEAD THOUGH BOULDERS TO STREAM WAY SAME STREAM AS AT BOTTOM OF 10' A DROP DOWNSTREAM OF 10' DROP. STILL GOING DOWN STREAM FOR SMALL INOTS AFTER A HARD TIME. TO THE RIGHT OF LADDER RIFT CONTINUED FOR NOT VERY FAR AT ALL TO CLIMB UP TO MUD FILLED END.

FROM SAME SURVEY STATION. ~~SURVEYED~~ DOWN PASSAGE TO CASSCADE TO SUMP. (THINK THIS WATER FOLLOWED IS SAME AS SEEN 'N HEARD IN RIFT AT BOTTOM OF LADDER RIFT.)

~~ALSO~~ SIDE PASSAGES +

ALSO SIDE PASSAGES NEARER ENTRANCE SURVEY TO CONCLUSIONS. FOLLOWED PASSAGE DOWN FROM LAREDO JUNCTION TO BOULDER CHOKE (DRAFTING TO SURFACE)

SURVEY DRAWN UP.

SORRY ABOUT SMELLING

ASH

SUNDAY 26TH JULY ?

DIG AT CAVE 840.

JUAN, PETE SMITH, PENNY, JENNY, CAROLINA, JOHN, NANDY, Q.O.W.

RETURN TRIP TO THE 'BLOW HOLE' THAT STOPPED PROGRESS IN LAST SUMMERS TRIP. THREE HOURS OF DIGGING GAINED ACCESS TO THE BODY SIZED PASSAGE NOTED LAST YEAR. CRAWL OVER FOX SHIT LED TO APROX 80m of LARGER PHREATIC PASSAGES. SEVERAL CLIMBS, SQUEEZES AND RIFTS WERE NEGOTIATED BUT NO OBVIOUS WAY ON WAS FOUND. ON THE WAY OUT A SIDE PASSAGE WAS FOLLOWED DOWN A CALCITE SLOPE TO A DESCENDED 1½ m DROP WITH THE CAVE 'WIDE OPEN' BEYOND. THIS WAS LEFT FOR A RETURN TRIP. THE DRAUGHT AT THE ENTRANCE WAS AGAIN "REASONABLE".

✓ ANDY G TRANSPORT

25th Sat July 92 892

Steve O Pete i Eaga [redacted] Andy Gower

Returned with aim to bottom big pitch which we had not previously seen.

Reached previous limit easily gardening on the way rigged forth ladder pitch which is awkward at ⅓ down.

Hammered out squeeze (10 minutes) and reached the top of big pitch. Top of big pitch required a bit of gardening and a great deal of care.

Bolted the head of the [redacted] pitch (Toby said it was 30m?) and Steve descended but ran out of rope (60m rope) and suffered equipment failure ie pebble in spit and jammed on driver.

Surveyed out from head of pitch back to entrance.

PTE

28.7.92 Andy P, Rich B, Gravel

Checked out the sites Numbered below

624 - Small stream sinks into too tight rift choked no draft

601 - Pot 15' deep choked, no draft

893 - New site, Pot 25' deep, too small choked rifts, no draft, about 100 yards East of Barn in the Side of track.

26th 7-92 892 ✓

Steve O + Peter T Eagon.

Returned to head of pitch with electric drill lots of spits. Steve succeed in reaching the bottom of pitch. Two deveations and two re-belays. Followed small outlet down rubble slope through blocks in narrow passage straight, a head choked but on returning back out a small pool on the left was traversed (very easy) to enter a larger low stream passage this was followed easily to a corner where water sinks through small holes further on passage ends in boulder with small climb down (From corner passage is large) surveying out a rubble slope was climbed and seen to continue easily this was left open further up stream, while Steve fettled cavside Peter crossed a sand bank into

an easy walking large sandy passage (this had been noted on the way in) Intending to put a few legs in this passage we started surveying in, not expecting more than a few legs.
The large sandy passage got bigger then smaller then bigger then smaller etc etc until it became very big 20m wide 15-20 high, we then decided it was time to leave and finish the survey. From the junction a few leads were noted in the large passage and in the entrance stream passage we left the cave with plenty leads to look at only 3 hours late.

Surveyed 1,050m

PT Eagan.

27-7-92
Steve O, Peter T Eagan, Andy Quin ✓

RETURN TO THE MAIN PASSAGE LEFT FROM YESTERDAYS TRIP. SURVEYED ON IN VERY LARGE PASSAGE NOTING SEVERAL SIDE PASSAGES. APPROX 300M LATER THE MAIN PASSAGE ENDS IN A LARGE CHAMBER WITH DEEP POOLS IN THE BOTTOM. THE ONLY OBVIOUS WAY ON IS ALONG A MUCH SMALLER PASSAGE OVER CLIMBS, ALONG RIFTS AND TRAVERSING. 200M LATER A BOULDER CHOKE ENDS PROGRESS BUT A PITCH DOWN APPEARS TO BE THE SOURCE OF THE DRAUGHT A FEW OTHER SIDE PASSAGES WERE NOTED IN THIS END OF THE CAVE. RETURNED ON TIME.

SURVEYED 470M.

246 ✓ ANDY G TRANSPORT

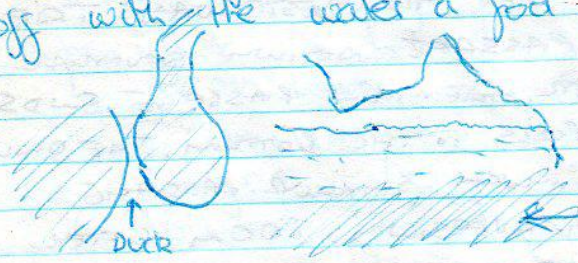

28/07 PETE SMITH ANDY G ANDY S.

Following Pete's Solo job last easter (unsurveyed/unwritten) entered with aim to survey/push. Surveyed from entrance in.

Instant flat out breathe out bedding plane expanded slightly to low crawl of Approx 30M length to junction with stream and muches solid sediment false floors. A fairly strong draft was still apparent from both up + down stream.

Care was taken to avoid collapsing upstream Mud bridges into the streamway and an initial push was made to the more prominent upstream surveying as we went. After Approx 45M the passage dropped to water level. A smaller silted up passage went off to the left but a promising duck was noted. This wasn't pushed due to the down stream requiring surveying. The down stream section followed long silted pools to eventually end up in draying boulder choke. A station 23 a connection with an upper level passage was noted but not looked at.

Returning to the Duck at the top end of the Upper Streamway a small amount of freezing yeilded a smallish chamber with ~ 2 foot airspace and a smaller Mfty passage leading off with the water a foot from the top.

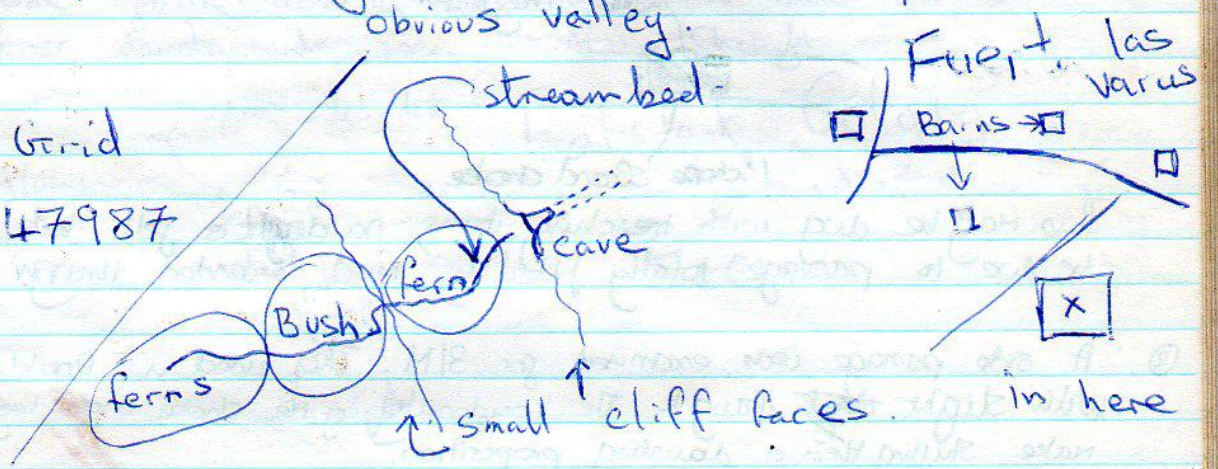

The right led to chamber and well washed dry passage leading up from silt "Beach" - potential goer? Due to sato trip only looked at 20M (Pete and Andy S objected to getting clean!) No surveying or further passage looked at. Due to sumpiness of the rock water and silt with the very well washed upstream of duck maybe other passage??? Returned to grap, freezing nuts off returned through bedding plane and out in 20 mins. Total duration ~6 hrs Total length surveyed 234M. - Andy G.

29 July Grovel & Julie 895

When walking yesterday (28/7) saw obvious hole in opposite hillside, so went to check it out. Basked up from ~~mushroom~~ mushroom field, this was a mistake. Easy way is to drop down from Llewva road. Cave is a resurgence which has entrance part blocked to form pool. This is used by farmer as water supply. Goes in 20 ft to a flowstone blockage, can see over top & passage continues. Good echo. On hot day had detectable cool draught.

Flowstone could be smashed but other things are better prospect. Very difficult to find, approx plan below.

29 JULY

JANE, TOBY, ANDY Q, PEDRO, ANDY P. RICHARD, GRAHAM.

FRESNADO II

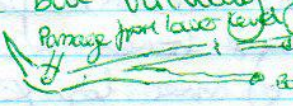

Up ~~tt~~, cascades & shitty streamway then off to the BLACKNESS. Handline down into chamber Pedro visited last summer. Nice big chamber with a choked pitch (6-5m). Lots of stuff but see MANYANA cos BEER BEATS BRAIN AGAIN! Lugger.

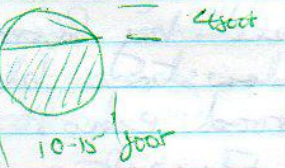

~~28/7/94 - 92~~ ~~STREAM II~~

~~PAUL, PAUL, PAUL~~, short climb led to passage with traverse ending in Avens. Draught comes from a passage to R. Short pitch to mixed going ending in 6m (ish) pitch. No gear so left for later (see 30 July) Richard & Toby tried a climb in the big chamber. Passage visible but need some bolts.

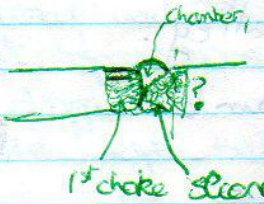

29th July. ANDY G. ANDY S. 246 ANDY G TRANSPORT.

Returning from yesterday opted to push the higher level 1st whilst still dry. Initially headed in upstream dirn. Surveyed 15M before rift finished in tight slots. Downstream dirn yielded more passage. A fork was initially taken to left. Much of passage was large tube but virtually filled with sediment.

① Some calcite + straws observed passage ended in Mud choke. the choke was pushed yielding a small chamber, also another choke:

This may be dug with trenching items, no draught is felt but could be due to passage totally filled by mud descended through rift slots.

② A side passage was examined for 3|M. This ended in Boulder choke with slight draught. The complexity of the choke and large boulders make shifting them a daunting proposition.

Descending back to lower streamway level and returned to the duck, After much cursing and retraction of testicles the passage was surveyed. The general impression was of well washed dry streamway. The duck may have been a sump connection but obviously not checked.

The streamway went for 42 Metres before the Boulder choke. Another continuation was found by wading for 15M but this ended in another choke. a small draughting gap was found with possibility of further passageway.

Total length of passage surveyed = 207.5M. Today
Total system survey = 441.5M.

30/7/92 ALPINE CHOUGH 099

Steve O, Pete E, Andy S, ± Gonel.

Aim to (*have a look at some of the other leads in the upper main chamber.) Began by dropping the pit nearest to the 2nd pitch; gained by a climb up a sandy gully to the right of the pitch base. At base climb a large 10×5m "passage" with numerous ways on. Most ways seem to lead to further deep pits but others tend to spiral down to further drops. Ways on as yet unpushed. There is a possibility of a slight draught coming up the pitch at our Stn O.

Cave ~~468?~~ 635' long and seems to tally with the level of larger development seen in Alpine Chough.

in Alpine → C

pitch undescended

pitch 12m ?

pit.

"Lots of Glory Walking"

Steve O.

Gonel - surface recce party:-

30/7/92 Andy P, Rich B, ~~Sara~~ Sarah, Dennis
HAPPY HAPPY MIFFED OUTRAGED.

* GET A P's L HAMMER BACK FAILED.

FRESNADO II Grotty, muddy, knee knackering hole

Returned to pitch left by Rich, Toby, Jane 25' down to small chamber followed by a narrow muddy rift. A small draughting hole which lead to the top of a pitch dropped pitch which turned out to be blind, but a hole back near top a passage lead off, draughting strongly. After a few feet the passage opened out to walking size passage still draughting well. Returned to other's leaving the cave going.

very well for the next trip.

Rich

28 JUL 92 SIMON II

PAUL, PHIL MILES, LANZ., LIZ & GUNNS

RETURN TO BIG ~~LOOKED~~ AT EASTER 92 - ATTACKED CALCITE FALSE FLOOR WITH INSTRUMENTS OF DESTRUCTION PURCHASED ESPECIALLY FOR THE EVENT; TAKING 10 MIN. STINTS PUNCTUATED BY FLAN JACKS GOBBLING SESSIONS A HOLE BIG ENOUGH TO FIT MILES TOP HALF (ie. BLEEDIN ENDEAVOURS) WAS ACHIEVED AFTER SEVERAL HOURS. A RESTRAINED GATHERING BEYOND THE SQUEEZE WAS ORGANISED BEFORE A ~~PUSH~~ STAMPEDE TO GLORY STARTED. A SMALL CHAMBER WITH A CALCITE FLOW (WHICH FORMS THE SQUEEZE), FLOWS DOWN A PASSAGE (~20m) TO A BALCONY LOOKING OVER A PHREATIC CHAMBER WITH A STREAM CANYON AT THE BOTTOM. DROP TO BOTTOM ESTIMATED AT ~30ft WITH A POSSIBLE TRAVERSE TO LEFT. TOO SCARY TO ATTEMPT WITHOUT PROTECTION. RETURN PLANNED FOR TOMORROW WITH BOLTING KIT + LADDERS ETC.

30/July/92. Grovel.

Surface walking around Alpine Chough.

897 also marked M3 Rift in rock about 15m deep. Has been partially blocked by former. No draught detected. Tagged.

896 Obvious rock shelter about 15ft high by 15ft diameter. Has set of steps cut in left hand wall. Tagged.

168 Now also marked M4 SEAO in green paint.

Q: WHATS RED, WHITE & RED & FLOATS ON THE SEA ?

A: DENN IS WITH HIS CRACKERS OFF.

898 Group of 4 shake holes and one rock shelter. All shafts are 10/15 ft deep, with no draught. Rock shelter is 30ft front to back and 20ft wide. Marked slope to right side. Drop 5ft to top of slope from entrance, then further 10/15 ft to lowest point. Has no detectable draught. Rock has old decayed calcite stall. Rock shelter tagged. Shake holes run down field in a line

899 Prominent cliff face 15/20 m high with bushes at either side of entrance. Entrance is 5m high and 8m wide. Passage goes into hillside in straight line. Mist can ~~tree~~ be seen rolling out of floor level. Old fossil stall in quantity. Can see in 50ft, but did not see back wall. Used by cows etc as shelter so floor at entrance covered in shit. Also numbered M22 in green. Tagged.

900 Also marked M6 SEAD. 6m diameter shaft with tree growing out of side. Stone drops for 80/100 ft, followed by rolling/bouncing until 150/200 ft depth. No apparent draught as tree not moving.

31 July Julie, Herman, Gronel.

Walking on ridge between top of Mostajo valley and Cobadal.

906 Shaft in grassy area. Stone drops to 15 m. 1m square entrance obscured by grass & ferns. Tagged.

907 Shaft/shake hole by side of new road. Can walk/climb (easily) down side (care) from roadside. Bottom has holder jammed ~~in~~ across hole. Could be removed. Way on seen for 15 ft only. ~~=~~ Draft not detected.

31/7/92 Toby, Richard, Andy Pringle, Chris, Jane Fresnedo II ✓

From the large chamber we went along the passage surveyed 29/7/92 running ≃ N. We went along the E. branch of the passage following the draught to a 3m pitch & rift descended by Richard on 30/7/92. This leads to a 6m abseil part way down a ≃ 9m pitch into a passage leading off. The new parts of the cave begins here:-

A short crawl lead to a meandering passage about 2m wide & 2·5m high. This is a very pleasant walking passage for about 180-200 m. It then closes down to an old calcited crawl. Following this is a chamber about 6m long x 5m wide by 1·8m high. At the ~~one~~ farther end and is a shat crawl to a further small chamber with a tight (too tight but might enlarge?) tube in the floor. Back in the larger chamber is a draughting dig* through gravel to a boulder choke on the left as you enter from the calcite squeeze. The draught is very strong & this is obviously the way on. Other shorter inlets were surveyed on the way out including what may be a pitch by pass blocked at the moment by calcite to make it too tight but bigger beyond.

The return was uneventful apart from Jane & Andy having some silly problems on pitches & hearing Toby call from the distance 'I thought you two were making your way out!' We were, but at our speed not leaders & Wigmore speed! Jane did a survey of her bruises next day which probably measured more laid end to end than the cave surveyed!

Between this trip (above) & the next one written up in this book Rich Chris & Toby returned & dug through the (draughting dig)* into the part creaming stuff.

1/8/92 Grovel, Julie, Jane.

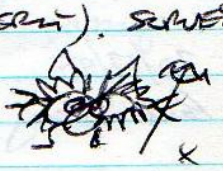

Having looked at the survey of Fresnedo II overlaid on the ground map, walked above Fresnedo church (track immediately behind church trending NE?) We asked a farmer at a cabana at the end of the track whether he knew of any caves or holes in the area. He pointed us to Cueva de Tejas (de la Cueva), so we felt duty-bound to visit it. We could not see any sign of downstream development as far as the dam. We then walked about 100-150m above Cueva de la Culva toward the church but saw nothing promising. We dropped down through the border of the eucalyphus forest & found a slightly draughting hole which Grovel says could be dug. We found a more promising site which has cool air & easy digging in boulders 2 fields above the church.

29 JUL 92 SIMON II

PAUL, PHIL MILES & OGNYS

PAUL&OGNYS SURVEYED FROM JUNC. BEFORE CALCITE SQUEEZE WHILST PHIL BANGED BOLT IN FOR TRAVERSE. SURVEYED TO DROP OFF BALCONY & GOT PHIL BELAYED TO FAR SIDE OF TRAVERSE. WITH TRAVERSE ROPE IN SOME EXPLORATION WAS INDULGED IN. STREAMWAY DOWNSTREAM LEADS TO A DEEP POOL (WHICH IS PROBABLY UPSTREAM END OF KNOWN TERMINAL SUMP) UPSTREAM OF HERE SURVEYED TO ABOUT ~80m TO SUMP. (DOG LEG ALSO SURVEYED). GENERAL POKE ABOUT UNTIL A HIGH LEVEL ROUTE/PASSAGE WAS GLIMPSED, THIS WAS EVENTUALLY ENTERED VIA A TIGHT SQUEEZE UP THRU' A RIFT ABOVE THE MAIN CANYON. ~200m OF VERY NICE PHREATIC PASSAGE WAS SURVEYED (INC. NUCHO STATZ) UNTIL A JUNCTION WAS REACHED. PASSAGE WAS NAMED 'BLUE BOTTLE PASSAGE' AFTER A DEAD FLY WAS FOUND. PASSAGE VARIES BETWEEN TRAVERSE & KNEE DEEP POOLS WITH OCCASIONAL SIDE PASSAGES (NONE CHECKED PROPERLY). SURVEY FINISHED AT T-JUNCTION WITH TWO WAYS OFF.

TU = 7 HRS SURVEYED ~300m.

RELAXED!

1/8/92 Andy Q + Peter T Eagar 892 ✓

Regatos

The original purpose of this trip was to push the Sqalber choke and take sediment samples.

Due to illness party was reduced by one, so objectives were changed to a short trip taking sediment samples with ½hr spent at the down stream end of cave (which is chilli open a going).

Sediment sampling took a long time but was successful (see Andy Q). After the sampling we decided to head down stream but noticed a small hole in the side of the passage (previously marked by Steve O') once inside the passage varied in size from walking size to crawling, areas of the passage are coated in mud and some areas are clean washed, after following the passage uphill we could find a reason to turn around (T & A junction with three ways on - SIS Junction). surveying out was a long slow process 70+ stations 400m left cave and sediment samples on one CEAG and a 200M. 9hr trip.

PE

30/7/92 Sinai II
Paul Stacey, Phil Hiller, Andy G, Herman

Took ~~left~~ left hand passage from T junction previously surveyed by Passage initially appeared fairly old with privileged stream in passage off to left was full of mud and required a lump hammer and a

person with no respect for caves so left for another time. Continued surveying main passage trying to avoid 8 foot straw etc with the tape. The passage continued for approx 150m lovely and wide with nice calcite flow across a wide (10m) passage. The passage eventually choked in a chamber with a 20ft diameter lake and a possible lead up a calcite waterfall entering the lake. This was not pursued and a return was made to the original junction. The right hand branch was explored and surveyed for 80m approx. It heads straight for Simon I and horizontally is only 16m apart and is on the same line. Vertically there is a 24m difference so either this is a lower level loop or else there is a drastic surveying error between the stations.

Phil.

1st August SIMON II. PS, AG Transport: ✓

P. STACEY P. MILES, ANDY G. HERMAN MUNSTER, ANDY Seton

P. Stacy + Herman took early lead and brayed hell out of 24ft of stal filled passage* (local confessional box went into overtime!) This was surveyed. (2en)

Andy G, P. Miles and Andys rapidly caught up (sort of?) and all 5 proceeded to the blue lagoon at the top end of previous days passage. PS, PM and AG started braying a particular lump of calcite to try and get PS into a possible passage above the falls. Unfortunately a lack of suitable weapons for a right spot prevented further exploration of the above passage. NEEDED, 24" chisel for 2nd August!!!

SUMMARY, MUCH BRAYING, LITTLE SURVEYING... A.G.

* ROUTE OF LEAST DAMAGE, HONEST GUV.

2-AUG-92 SIMON II

P. STACEY, P. MILES, A. SEXTON, A. GOWER & P. EAGEN

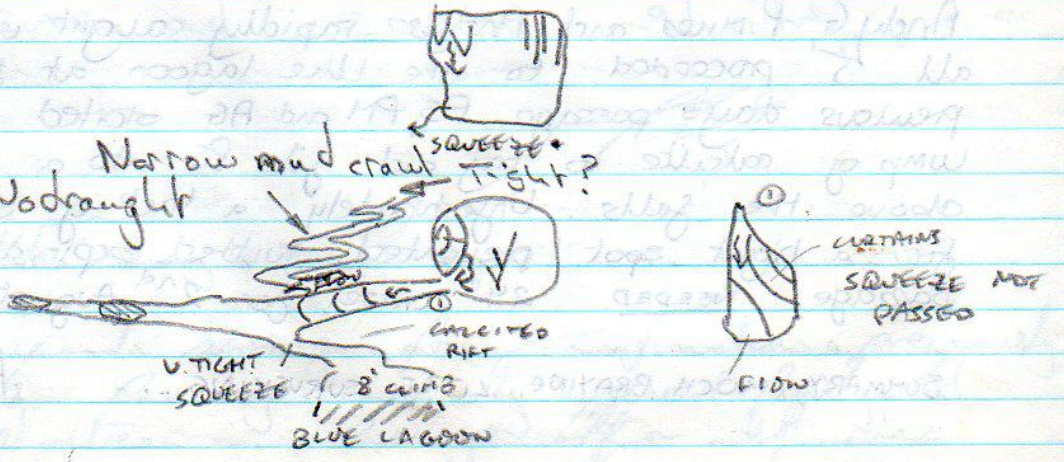

PETE & ANDREW PHOTO'D IN BEFORE STH. GOT SMASHED UP WHILST OTHERS RETURNED TO CALCITE SQUEEZE. MUCH MORE DAMAGE DONE TO SLOT THANKS TO LOAN OF CHISEL. EAGEN ARRIVED WAS PROMPTLY INSERTED INTO HOLE & WAS ABLE TO GAIN ACCESS TO CLIMBED PASSAGE ABOVE (WITH MUCH ACCOMPANYING CHEERING). AFTER A QUICK LOOK PAUL JOINED HIM & WE BOTH WENT ON. "DOWNSTREAM" OF SLOT CHOKES. 'UPSTREAM' LEADS UP & OVER MORE CALCITE FLOW TO YET ANOTHER SQUEEZE! AFTER A CRISIS OF CONFIDENCE (ABOUT 1 SECOND) PAUL SMASHED OFF MOST OF THE CURTAINS TO ENABLE A LOOK INTO CONTINUATION. WATER APPEARS FROM CEILING FROM YET MORE CALCITE (ANOTHER SQUEEZE?) & THERE APPEARS NO WAY OUT OF THE CHAMBER BEYOND THE PRESENT LIMIT OF EXPLORATION. AS MAJOR WORK WOULD BE REQUIRED TO GET ANYBODY ELSE THRU' WE CALLED A HALT. CAVE DERIGGED ON EXIT.

& STH DRAUGHTING STRONGLY

STUFF STH TO BE LOOKED AT / DO

1) SQUEEZE (SEE ABOVE) TO BE PUSHED
2) PASSAGE ON R.H. & BELOW NEAR STATION (PS 31) (INITIAL)
3) DROP LADDER TO FAR SIDE OF POOL - OR USE BOLT AT START OF TRAVERSE TO CHECK FOR SUMP.
4) POSSIBLE H. LEVEL PASSAGES NEEDING BOLTING AT ROOF LEVEL NEAR DEEP POOLS IN 'BLUE BOTTLE PASSAGE' A HOLE IN R.H. WITH IN BIG DRAUGHT OFF ↑.

See back of log book 901 - 904

(21)

31 July 92 - Pete Egan, Steve O, Andy Seth

Walked from Cruz Uzano following the line of the ridge in the direction of Muela. Tagged several holes en route but the notes for which seem to have been mislaid. The most significant hole was located in the approx region of grid ref. 456·000, 4[illegible]5000. A large sink led down to to the top of a pitch which had been marked SEAD M45. The trunk of a tree straddled across the top of the pitch enabled a stone to be dropped straight down, and a six second clear drop was recorded. The pitch entrance is long but narrow, perhaps 30/40 ft long and curving round to a scree slope.

Summary: its a long, frigging hard walk for anyone who wants to descend this pitch.

Andrew Seth

3/8/92 Fresnedo II

Rich, Chris, Pete S, Andy P, Andy Q

Returned to passage left "still going" by Toby Chris + Rich the day before. Surveyed in for 740m Many side passages noted but not followed to conclusion. Stream way seen in gratty rift below main passage. Trip planned for 4/8/92 to continue from point at which group turned round due to time. Way on still going heading for Simon II. Watch this space. ADP.

3/08/92 Surveyed up from Stn 26 into high level oxbow. Surveyed from Stn 7 in low level oxbow. Surveyed from chamber at end of 1st trip into big stuff along a high level crawl to past a bat skeleton to a drop (6m ish) needing a hand line + a bolt. NO BELAYS. Passage could be seen to continue in the far wall of the chamber.

TOBY WAITE TOURBIT

One Sunday.

Juan, Penny, Jenny, Andy P, Richard, Susan, Steve, Kyp, Linda, Jae, Reg, Pam, Graham, Andy + Julie.

Blanco Trip - to do as many bars as we wanted.

Bar Germen followed by an approximately 500 m drive to a passage on the left which ends in a choke - Bar las Nieves. Passage to the right leads to a dangerous place which is now ~~poisoning~~ poisoning our bread. Follow Dorian route to the right which leads to a small dark chamber with a lot of del formations around the edge. Dorian went in to the left but this was ignored due to lack of bars and the route was retraced to Dorians T- junction. Turn right and follow well decorated, spectacular passage with a lot of large gypsum pile until clear left turn. This can be followed until a bar with a pot roman leaps at a you. Eat an lot, drink a lot and listen to the moaning. After refreshments follow retrace steps to left turn, cross the stream and follow large stream passage to T- junction. Turn right at to another large black hole which is well decorated with bottles + glasses. Several large chambers exist in this area all of which need more investigation. Follow Dorian route and look at more well decorated chambers until a left turn appears after a winding passage.

This leads to a final choke which has a lot to offer and is well worth visiting as it has abundant wild life including ferrets.

4/08/92 Fresnado II
Neil Facey, Richard Jones.

Decided to investigate the howling, well equiped with wet suit's plus hoods etc, The passage leads into a low pool with limited airspace, This was best approached feet first and with a good kicking managed to turn the pool into a good river of shit, the horror Continues for about 30ft until eventually we scraped into the big stuff, brown passage lead to a short boulder choke and a chamber above. A right passage Continued onwards leading to a 2nd short boulder choke, A climb up Connected us to a familiar chamber and Survey station no 32 close by. The howling was worse on the way out due to Richard's chocolate wave maker machine, etc There is still plenty of passages leading off from around this area, classic misery at it's best!

4/08/92 FRESNADO II TOBY, JANE, ANDY S. ✓

Instead of climbing up into Cascade Stream we followed slope up to climb. (Surveyed 18/08/91?) Short climb to decorated Grotto and continuing climb needed bolts to gain chamber/passage 6m above. SEE 14/08/92

Continued into cave as far as Big chamber and did a climb into totally choked passage. With bolts it will be possible to traverse into the obvious passage next to the shit I climbed into. Thanks to Andys good light we noted several other passages in the walls of this chamber.

4/5/92 Aspiraquarer Phil P. Andy Hall, Ray + Giles, Fran.

Shagged up the hill - went down the hole, Replaced some spanish Rigging - a superb pitch and we got to the BOTTOM went under Animal passage towards a chamber with a climb up to some unknown treasure! (Survey station 26)

Surveyed 10 Meters of passage with a few leads off! Some funky formations, leading up to a choked climb - the golden boys (AH, GB, RD) went off for a gaw about, AH thought he was still at school - there's loads to get going on it now. Went out after we finished - the Big Pitch is good - went to the top - and a good night was had by all. The golden boys did well on their bikes and Giles managed to stay in his gear all the way out - AH Head Lamps were playing up and we had to have a major pit stop for trains! GB New tyres were performing well, and recomends them to others!! AH Visor got 'short - up' but the doesn't like lots of 'down' so he left it like that, these New 'by Laws' anti scratch visors are a good idea. Overall it was a splendid track and the bikes were on form. PS No one came off !!!

2/8/92 - Riano. Lank, Sarah, Bobby, Andy H. Giles B, Ray Digby-Philip P.

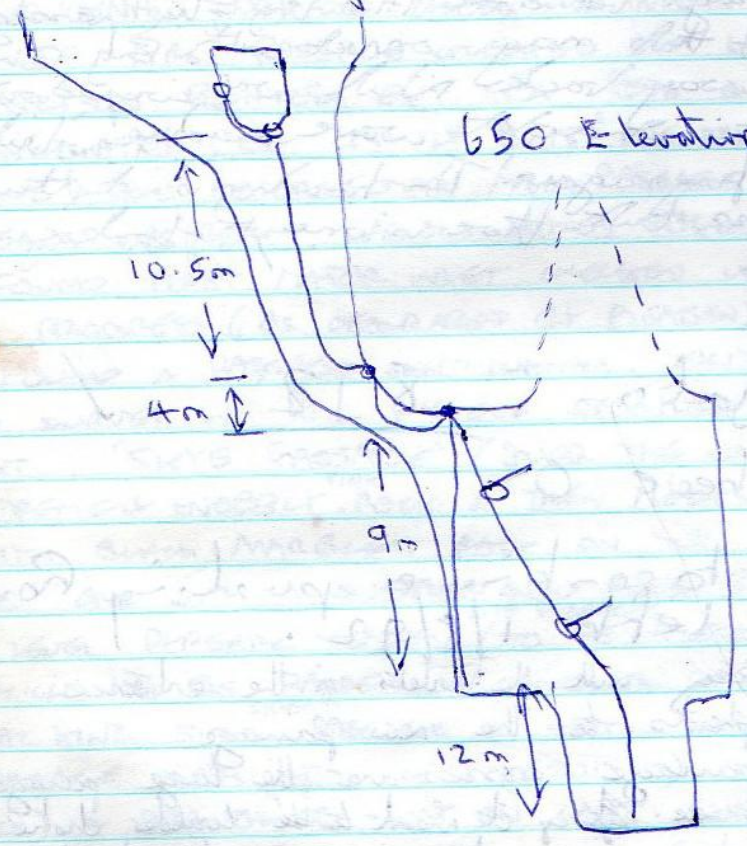

Downstream to look at passage & inlets on left not far from end. Inlet passage splits into two smaller inlets about 30m from main passage. Both inlets go to major choked areas. Right hand inlet followed into choke for about 30m.

About 15m further downstream on left is steep boulder slope up to climb up boulders into a chamber on a fault. Two avens in roof. Inlet passage across chamber followed to abrupt walking passage to low inlet & choke. Surveyed out - 40m.

5/8/92 - Fuente de Alisa hole. No. 650. (See 1987 log) Shaft located on Vega side of the summit about 100m below summit ~~tower~~ tower. Surface survey from tower to hole done.

Ray descended on ladder down loose gully but returned & we decided to rig a rope for a safer & easy

as there was lots of loose crap. Rope rigged from thread & natural spike down rift (10.5m) to top of squeeze with pitch below. Used Mr Bosch to put bolt in roof

Gives continued exploration from here through squeeze & down next pitch (9m) to land in siliceous chamber. with another pot in floor.

5/8/92 - Fernando II - Neil P., Rich S.

Went back thro' Howling to dig it out but after two hours made it worse. Surveyed the passages behind Howling by passages Sawing passages in the roof that may connect with Big Chamber. It needs looking at! On the way back Neil was swiped out on his roof board in the shallows ~~wave~~ machine but survived, so he'll be surfing again! The howling is not the by-pass promised, it's gone, but there is one, by looking in the big chamber.

4th-8-92 ~~*~~ Regaton- 892 ✓

PT Eagar. Sheve 'O'

Purpose of visit to continue pushing Rom end of passage left 1/8/92.

Left Phil M and Paul Stacey with the inlets in the entrance series and made the shepherds to the new passage.

According to the survey the passage crosses over the large passage so we were pretty keen to see ~~if~~ if it went to the ladder choke However after 30 minutes of strenuous effort we emerged into the large chamber on the LEFT of the main passage. Uh oh something's gone horribly wrong we thought!! Basically knew something was wrong & so ~~left~~ hot-footed it to the ladder choke gained from the opposite side of the pit in Peaky Passage.

Steve armed with his trusty bit of string heads off into the ladder choke in search of "mucho glory". Draught is howling through choke but way through is v. dodgy. However the ball of string is still there if anybody wishes to have a go.

On way out of cave met Paul and Phil surveying into glory - GITS!!

Attempted climbs at base of big pitch. Short climb up leads to steeply ascending passage with a climb up to new to 2nd rebelay. Nothing doing.

Left cave and ran home to dinner.

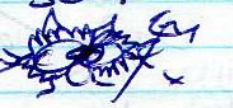

Steve O

4-AUG-92 REGATON (B92)

P. STACEY, P. MILES + {P. EASTON & S. ORPENSHAW (SEE BEFORE)}

ORIGINAL TASK TO CHECK ALL INLETS BEFORE MAIN JUNC. TO BIG STUFF. FIRST PASSAGE CHECKED OFF LH. SIDE JUST AFTER MAIN JUNCTION POINTED OUT BY PETE ON HIS WAY IN. MUDDY PASSAGE PUNCTUATED BY CRAWLY BITS & EVENTUALLY CHOKED AFTER 80m. PAUL & PHIL RETURNED TO MAIN PASSAGE & STARTED TO LOOK AT ALL LEADS UPSTREAM. VARIOUS HOLES POKED ABOUT IN BUT NOT MUCH FOUND. FIRST MAJOR INLET CHECKED WITH DEEP POOL STOPPED PROGRESS (AS DESCRIBED BY P. EASTON). OXBOW BYPASS TO POOL FOUND & PASSAGE CONTINUATED. EXITING TO START OF JUNCTION TO SURVEY IN PETE & STEVE INFORMED OF PROGRESS & LEFT TO CONT. OUT. 'SKYE PASSAGE' (OVER THE WATER & FAR AWAY) STARTS WITH EXTREMELY KNOBBLY PINT ROCK & THEN MEETS WITH A FAULT(?) WITH LT CONT. WITH BLACK MARBLEY ROCK ON TOP. SEVERAL DEEP POOLS TRAVERSED INC. ONE WITH A SUBMERGED ROCK BRIDGE. PASSAGE CONTAINS MANY H. LEVEL PHREATIC TUBES & 2 SIDE PASSAGES (TO BE CHECKED) & LEADS TO DEEP WATER WHICH MAY BE BYPASSED VIA ANOTHER OXBOW - THE CANAL ENDS AT A WALKING SIZE STREAM PASSAGE & CONT. THRU' A BREAK DOWN AREA. THE PASSAGE ENDS AT A LOW (SQUITTY) MUD PASSAGE (INC. DEEP QUICK-MUD POOL) & DRAUGHTS. WAT ON CONT. FOR AT LEAST 30'.

SURVEYED 80+220m TU - 9PM.

5-AUG-92 REGATON (B92) P. STACEY, P. MILES, A. SEETON

COULDN'T FACE THE MUD AT THE END OF SKYE SO DECIDED TO LOOK AT THE INLETS TO SKYE. VARIOUS THINGS LOOKED AT. MOST TUBES SEEM TO FORM A MAZE ONE AT ROOF LEVEL & EITHER END AT KNOWN POINTS OR GET TOO TIGHT.

WENT UP ONE INLET TO PASSAGE THAT INITIALLY WENT VIA A CHAMBER, OVER THE STREAMWAY & THEN BROKE OUT INTO A PHREATIC (NARROW CANYON. THIS ~~THAT~~ EVENTUALLY LEADS TO SEVERAL VERY TALL DRAUGHTY AVENS & PHREATIC PASSAGES (?) LEADING OFF, NEEDS ANOTHER LOOK. SURVEYED ~ 160m.

JUAN FOUND MORE CAVE THAN SALFORD PHIL!

lugger.

908

06/8

Big Roy, Toby, Julie, Andy Q. Graham, Richard, Lamb. ✓✓

Went to dig the shaft Toby, Roy & Jane, and Julie, opened up yesterday (strong buggar that Roy isn't he) 55' pitch with tight take off lands on boulders in big rift. Draughts in strongly at top. Squeeze down past tinsky things leads to small chamber and further squeeze down to too tight section above 40'-50' & drop draughting outwards! A couple of good smacks with a hammer would remove the obstruction. Both Toby & Richard found the return through the top squeeze easier than had been expected! (ie. they both got out again).

Draught appears to sod off through a boulder choke about 25' down. TAGGED 908.

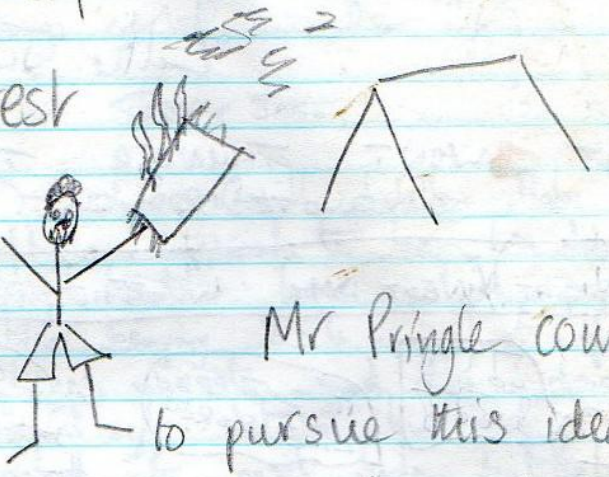

Another hole 15' deep & choked with blocks but no draught was descended 200m to NE of 908.

SHAFT IS PERCOS off 908? NOT TAGGED.

5/7/92 - 6/7/92

After bar experiments in cave detection.

① The smoke test

Mr Pringle could not afford to pursue this idea as he ran out of towels to burn.

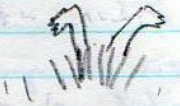

② The echo method.

Impractical as all the village dogs must have sore throats after practise session.

③ The drop test

(See Pam to find efficacy of this method.

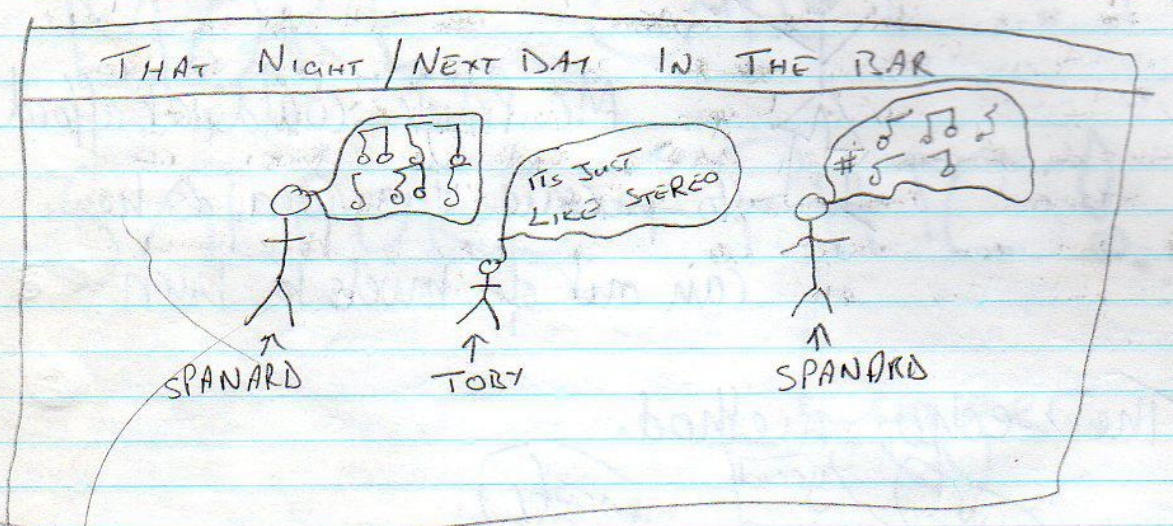

MALE

ALL PEOPLE WHO DONT LICK THEIR FINGERS AFTER^ PISSING OUTSIDE THE TOILET BLOCK DOOR STAND UP. ANDY HALL CAN REMAIN SEATED!

BUT IT WONT THUNDER TONIGHT

QUOTE: MR MILLS.

06/08' BASTARD PENCIL. NO: 11) SANTANDER,

JUAN, JANE, ANDY G, HERMON MONSTER.

AFTER Battling thro' miniature jungle entred Large entrance cave full of spike / Bradrips / Buckets / plastic / Boots / rubbish etc entred sandstone inclined plane approx 30° below horizontal. Grotty / smelly cave endowed us with 25M survey passage. Previous footmarks found for approx 150M probably Spanish cavers, apart from higher level rift cave kept descending and ended up in tight passage only Toby / Paul fat guy else cavers could continue °o° fat bastards like us turn around and survey out.

Tiefer Day.

Pete Eagan "I cannot keep it down even after using coral water".

8/08/92 253 TOBY & JANE.

Dragging holes (2) above Gorilla Walk. Holes are located correctly on map! Shaft is supposed to be 6m deep so 1 ladder was put down. Festering ~~bodies~~ bags which pop as you go past led to ladder hanging 3-4 m short of floor of dead animals, plastic bags, maggots and the remains of Toby's breakfast. No draught detected but not a good day for draughts anyway. Looked into next hole, but the presence of mice etc put me off. A real shit hole.

6/8/92

Azpiliceta. Giles B, Andy H. Chris Lloyd, Neil Povey (ASDALICHATA)

Returned to push passages found on 4/8/92. Dig at end of South ~~B~~ Passage attacked at two places by Neil & Chris. Both ~~per~~ ported to a small Gypsum chamber with 6 ways on! Draught followed through boulders to area of spongework and right hand hole in floor. Neil & Chris dug at end of right, Giles climbed in roof but Andy dug in ~~crawl~~ crawl to left and through a descending tube to a longer passage on a fault. This leads to a big black hole. Neil & Giles were sent back to the start of the extension for two ladders. Chris & Andy surveyed back while the pitch was rigged. 15 m pitch down tube on right wall of passage avoids loose boulder slope. Landing is on large block in big chamber - "At the Opera" 30m x 20m. Several ways on explored but most were blocked. Draught & main

way on appears to continue down another pitch at NE end of chamber – To be continued!

8/8/92 Ray Daffy, Giles B., Fran, Chaz, Richard, Keith.

Azpilicueta (Cont.) – Ray and Giles returned to 'At the Opera' chamber and descended the next 35' pitch into a fairly large chamber (GPB-Chamber) of steeply sloping sand floor. Searched, but found no draughts or passage anywhere (Damn). At the top of the pitch we met Chaz and Rich who had by-passed the 50' pitch by some spongework but were pleased to go back out up the ladder. (Ray and Giles went out via Leñada)

9/8/92 Mostajo ✓

Steve O + Pete E

Whilst Andy Quin's party did some "science" in the upper levels we decided to find Hedghog Crawl and have a go at it. However due to us getting a bit disorientated we were not at all sure of the passage description given to us. So we came out in order to be really early for the fiesta. Thus giving us maximum drinking time.

10/08/92 778 and others. Steve O. ✓

Toby + Neil went to drop the "unbottomed" 20m shaft of 778. Found to be quite a large shaft under brambles and trees. Recently fenced. 25M deep with floor of boulders. Part way down you pass through a heavily marbled band very similar to Marble Ledge on T.V. Mast. A 5m deep choked rift takes a draught but it would need a couple of hours of boulder moving to get down it.

(910) Found small fenced shaft about 175m SE of nº778. Immediately below old fence, 5m pot led to a sloping rift which ended in a choke after 10m, no draught.

(911) Undescended 5m shaft fenced with trees due ~~South~~ North about 100m below last mentioned hole, no draught, no echo.

freeclimbed choked rift 35m ~~South~~ North of last mentioned hole 5m deep no possible way on, no draught. 912

8-AUG-92 SIMON I ✓

P. STACEY, P. MILES, GROVE & ANDY GOWER

RIGGED ENT. WHILST GROVE & ANDY DO A SURFACE SURVEY. (THIS SUBSEQUENTLY SEEMED TO PROVE THAT THE LOCATION OF SIMON I WAS CORRECT, BUT SIMON II WAS WRONG). THE REALIGNMENT OF PASSAGES ~~SEEMED TO PROVE~~ ALSO JUNKED MOST OF THE SURVEY BUT SHIT SCOOTED OVER THE LAST FEW DAYS. CAVE RIGGED & THE 12' PITCH DESCENDED. A SQUEEZE CURRENTLY BLOCKS THE WAY BUT IT LOOKS AN EASY DIG. (OH NO NOT AGAIN!) (10m DROP AHEAD?)

9-Aug-92 121 Simon 1

P T Eagan. P Stacey P Miles.

Purpose of trip was to open up the dig at head of pitch and push on surveying any new stuff.

P Stacey + P Eagan. past the dig easily but Phil could not so he was left to engineer it bigger and wait (which he did) ~~4~~ hrs approx digging.

Past the dig a ladder pitch lead to a narrow rift with upand down stream section, small but going.

Down stream lead to a flatout tight section in water which was ~~*~~ latter bypassed to give and easy way in. Down stream slowly increased in size and lead to a climb then a ladder pitch down. which left and surveyed out from the pitch, slow wet going.

PT Eagan.

10/8/92 Aziplicveta. Giles Barker, Ray Duffy Andy Ham
Purpose - photography & survey in new stuff.

Smooth descent to Main Chamber. Carried gear through to Sardine chamber at base of climbs into extension. Andy threw a rotter after two attempts to climb up into the extension. The ladders had been removed on the previous trip. Ray & Giles decided that they could not photograph with only two people. We retreated back about 100 m to a junction with an unsurveyed passage heading south, pointed out to us by Phil on a previous trip.

This passage, Selenite Crunch, is well decorated from floor to ceiling with gypsum crystals and ended after about 80 m in a boulder choke. While Ray & Andy surveyed Giles set up camera gear to. After finishing survey we photoed Selenite Crunch & it did not! We returned to the Pipe Cleaner where Giles tried to get his drum of photo gear round the tight bend so he decided to use the ladder route while we were negotiating the P. Cleaner, before he left he asked us to shout at the chamber because that was the only bit he wasn't sure to find. We reached the chamber and waited using the whistle and shouting but he didn't shout. Neither of us knew this confection so we searched around the chamber but after an hour we realised there could be a serious problem. Andy could he get back up P.C. but I couldn't, splitting us up even more and with lights getting short on electricity and on carbide we made our way out. We left a cache of spare carbide, a duracell and a note just in case he had got lost and ran short of light but still made it to the chamber (7.30pm). We got out at about 9.15 ~~pm~~ pm and raised alarm. Phil P led a party down Repulsante and found Giles' body at the bottom of a 20m pit near the ladder.

~~Pits Bank~~

10-Aug-92. 121 Simon 1

P T Eagan., P Stacey, P Miles.

Returned to head of pitch complete with Phil who had made an excelent job of enlarging the ~~pitch~~ tight pitch head.

The second squeze was also made larger.

We descended the ladder pitch to the head of another ladder pitch which lead to a small chamber and wet second of passage which gradually got smaller. We surveyed out taking photographs.

A short distance before a small inlet, which goes 40m splits and closes one (LH) branch ending in a slot section of rift, a climb up in the roof enters a section of well decorated phreatic Passage ending in a sandy easy dig. Opposite this section of passage a easy crawl enters a 5m dia conical stalagd chamber with a way out which ends in tubes and climb up which need gripping. Up stream at the bottom of ladded pitch (below tight section) mixed going devides and splits LH second end, in a closed rift and the ~~RH~~ RH need a little digging to enter a small continuation.

P Eagan

7/8/92 Alpine Clough 99

PTEogan, Steve 'O', Andy Pringle, Andy Seaton.

Two Parties:- one pushing & surveying
:- one pushing photo & surveying.

Team I Steve O & Andy Seaton :- Dropped pitch into stuffed chuff passage and they looked at / descended shafts in floor none went.

Team II PeterT Eogan & Andy Pringle
Pushed / tied up loose ends around large chamber surveying & photoing on way. Then dropped down into stuffed chuff passage via crawl & climb.
(Bye passing Steve O & Andy S pitch)
Both teams then exited via cave & derigged.

897 PTEogan descended shaft 30m deep ~~&~~ no way on.

13/8/92 Reñada: Fran, Richard, Jules, Andy Pringle, Joe, Jane.

Trip to 50' rift in Sanatogen to clear up green way marks & get hammer & bolt. All the waymarks we could find have now been removed except the orange ones which were in there originally. A piece of rope has been left in as a hand line on very slippery calcite below original 2nd pitch in entrance series.

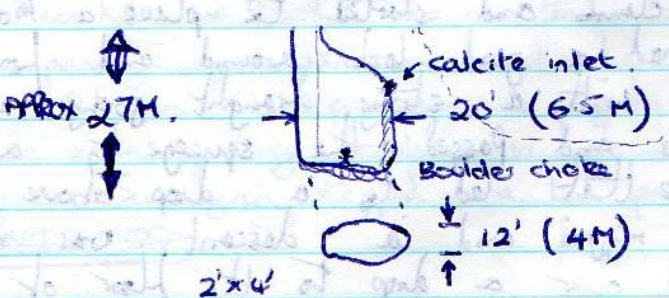

~~14/8/92 Fresnada II Jane, Toby, Pete, Steve Clifford 92~~

~~Climbed the calcite at the end of the~~

13/8/92. Moella. ANDY Q, DOLLIE, ANDY G, PETE S + CAROLINE (SANDWICH PORTER!)

Two aims: Find Gypsum blocks in bottom of big shake/aven and drop 319 / 320.

Suprisingly for us (not including Andy Q) The blocks were rapidly located all be it damaged and attention was focussed on 319 + 320. M50 or what was determined to be 319 was dropped to a depth of 98' (ANDY Q FIGS) or 80' (ANDY G FIGS) - Yes I forgot to ~~tie~~ tie the Magic Knot!

A small calcite inlet + gall was seen but as it goes directly towards the depression and is unreachable it is a fairly safe assumption it is ~~not~~ a gear. No draft detectable and boulder choke floor.

320 We assume pete located the correct orifice and climbed down unaided 4M to a draftless choke.

The End, ANDY G

8th August - Fresnedo II - Chris Lloyd, Herman, Rich, Pedro.

Went into extensions to do various side passages. Rich and Chris attempted the calcite climb out of chamber, but couldn't get up. (promising to return with suitable tackle.) Meanwhile Herman and Pedro pursued a sandy passage which after 200 m. reached a small stream. This was surveyed and Chris climbed up the stream cascade and found a high-level passage which was quite complicated and needs pushing properly. On the way back the first junction on the ~~left~~ right was followed for 100 m to a draughting dig. Herman named this passage "Job's Defiance." On way out a minor problem, that Herman got lost in entrance series. A major problem - car wouldn't start and had to be pushed for an hour.

Mostajo

14-8-92 Rich B, Chris L

Got to bottom of pitch found a few days ago 25m + 4m climb dropped into a stream way which turned out to be something that was allready know, done some surveying. Some possable ways on but nothing that good. Then debackled.

14/08/92 Fresnado II Pedro, Jane, Toby. ✓

Back up the climb and started to place a bolt for the next climb. Jane had a good look around and found an ascending muddy tube with a strong draught going up it. Toby dug for 5 mins and passed the squeeze to a chamber (small) with a passage that led to a drop above the bolting site. A ladder was rigged and a descent was made to where the ladder ended over a drop to the floor of the passage from the cascade. Toby bottled out of the exposed step onto a mud slope that led up to glory glory. He returned to the chamber and Pedro strode forth into the new stuff. The lifeline was tied off to a couple of stals and Jane lined Toby down the pitch.

The passage was followed for about 70m, up a short climb, to a pitch of 70-100 feet. Surveyed out and noted various passages which need doing. (Draughts strongly down the pitch)

On the way out we went to a chamber that was seen - but not entered - on a previous trip. A short climb led to another chamber with a climb up a muddy boulder slope at the far end. A too tight hole has a big space behind it into which the draught disappears. A booming echo adds to the interest in this area. This was not surveyed but it will be soon!

We did not have time to look at a passage, (1 min dig to enter) with a draught going up a mud slope, that Pedro had spotted on a previous trip.

14-8-92 Regator 892.

PT Eagar. Steve 'O', Andy Pringle.

This trip was dedicated in really annoying Paul Stacey a Phil Miles Shuge passage junk pushed by these two gentlefolk was left at a low muddy pool with a draught. We descended with the aim of photographing the main points of interest and finishing off Shuge Passage. So after a goodly irreverent set of photograph poses we set off for Shuge Passage. Got to the low muddy pool and waded through and after a goodly short crawl in muddy passage we popped out into a large 20×20m chamber. Yeeehah we thought as one tends to do on such occasions. The main passage from this initial chamber leads SSW and at varies from large 10-15m ×10 passage to pegged phreatic tubes. After about 460 m an area of large boulders is met still with draught blasting towards you. Surveying stopped here but passage carries on beyond boulders.

TO BE CONTINUED.

Richard – The man who doesn't know the meaning of the word 'choke'.

15 August Fresnedo II Richard, Chris, Pedro

Went into extensions, first task to survey lower route from Ecstasy inwards (from station 13 to station 5). Part of this was repeating an earlier survey by Toby. After that we explored a high level oxbow (between stations 19? and 14?). In the chamber a passage in the floor was followed by Richard. It was fairly small with a stream in the bottom and returned to the main drag along a rift already examined by Chris. This part wasn't surveyed.

Then we went to the side passage known as "Job's Defiance" (see 8th August). Richard continued his dig, and as boulders started to fall out of the roof he said it was "Situation Normal". He got through and disappeared, so that the others followed after he'd gone for a few minutes. The first they heard from him was a request for a crowbar. In the mean time he had dug through another horrendous upwards boulder choke, which had collapsed after he had dug through, so he needed the crowbar to get out again.

Then we all went up in to his discovery, a large rift which went on up another couple of boulder slopes at angle of rest. At the top Richard disappeared again into a series of small phreatic tubes.

In the opposite direction from his second dig the slope went up to a very nice passage with a wide flat roof, gypsum flowers, and a floor white with gypsum sand. It ended abruptly so Richard started digging again, but this time he was foiled.

Just beyond the 'Situation Normal' Dig Chris entered a stream passage with another higher level passage. This was neither pushed nor surveyed, so someone will have to go back.

On the way back we took a few photos of the nicer bits.

16·8·92 Regaton

Steve O, Pete É, Andy P, Rich B

Returned to passage found 14/8/92. Steve + Pete went to known end photographing on the way then looked at choke. Good draught way on should be found steering Rist week of 93 exped. Rich + Andy surveyed into side passage for 50 ish metres passage continues for another 15 ish metres to awen with several leads to push.

Cave de rigged on way out. Top deviation on big pitch left in (need crab). Very good prospects for next year.

Penny to Juan

"Is your hemet permanently broken or should we go to bed".

Sarah in Ranalar Restaurant:
"Shove it in - it feels really good"

16th August Sanatogen Joe, Jane.

Went in again, after the 13th August trip, to test out our suspicion that there is a lot more to the place than is realised. Only a straight-line survey exists for the main route through. Jane decided to survey in from the start of Sanatogen to verify this. By looking at everything we rapidly found stuff that was new to us, though had been looked at, at least once. Found that there was an active system below the fossil system familiar to visitors to Reñada, but it was very small — of Penyghent Gill proportions. One of these passages runs off from the area of the sandy squeezes near the aven chamber. It starts from a pit in the floor and rises up to join an earlier fossil passage above it which contains sharp formations. Jane followed this for about 20m but it continues uninvestigated. This was not surveyed. Another active canyon runs off from the aven chamber through into a wet aven chamber via a 90° bend (with fallowable fossil passage above) then continues, too tight ?. This was draughting.

Further into Sanatogen, at the area of the wide low chamber containing many potholes in the floor (potholes in a surface stream sense of the word), found an oxbow passage which passes through a loading rift or rather three parallel rifts separated by musical thin flakes of rock. Noticeable draught here (coming outwards) and it seems to go, but either hairy chimneying required above razor sharp flakes, or a tight squeeze through (lump hammer useful?)

A very nice example of a phreatic tube runs off from the wide low chamber — about body size — but Jane found it was choked.

Another oxbow passage near this chamber contained an animal skeleton near its entrance. It looked like a mouse but it could have been a bat. There were a lot of other bones here as well, of similar size, but these got destroyed by the passage of the survey team.

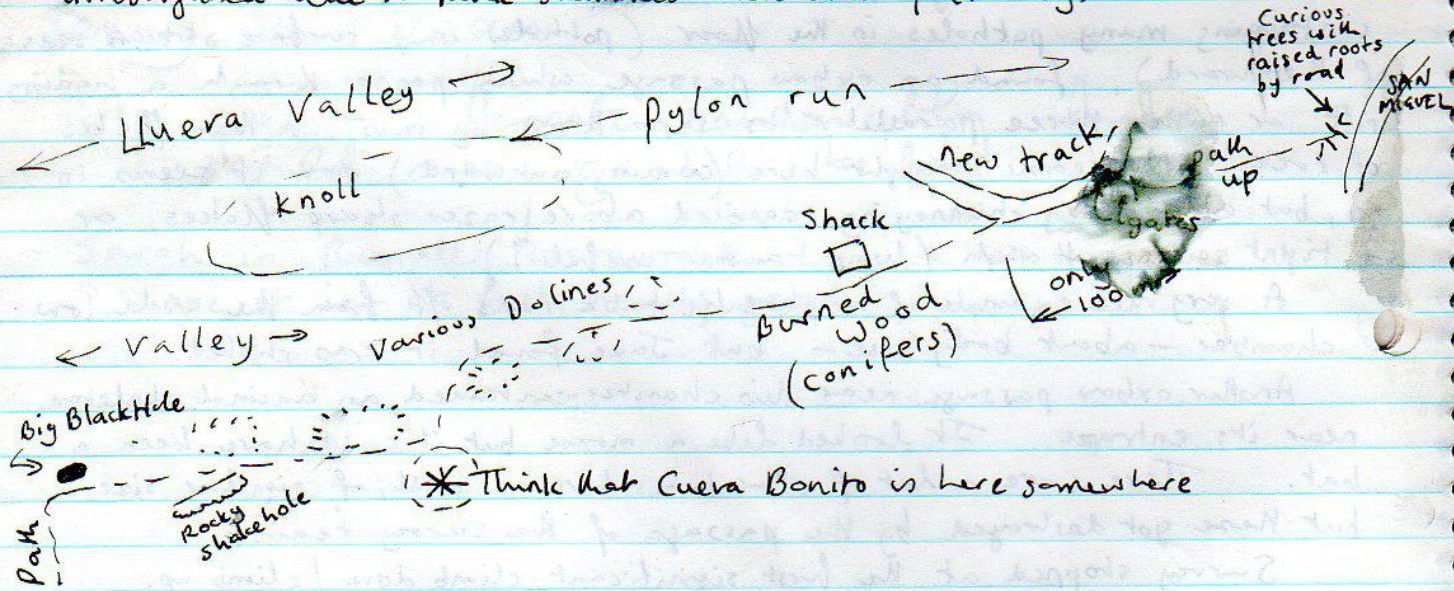

Survey stopped at the first significant climb down / climb up.

17th August. **The Lost Caves of San Miguel (Continued (from 1991))**

Joe: went up from San Miguel in yet another attempt to find the cave found in 1990 (Cuera Bonito) which was full of pretties. An attempt last year failed when the new tracks put in for the pylon construction diverted the walk somewhat.

This time managed to ignore the new tracks and rediscovered the correct path taken in 1990. The correct path is actually well defined for the most part and goes up through a burned forest, past a shack, then rises up a shallow valley full of dolines. Even though the correct area was recognised and searched as well as thick brambles and constant horsefly attack (in shorts) would permit, no sign of the cave could be found. It was very near a prominent solitary beech tree above the path, but none of the places examined looked right.

Further up the path where it bends sharp left there was a shaft:- a big black hole about 12m deep into a chamber. This was not investigated due to thick brambles and lack of clothing.

One problem is that brambles have colonised everywhere since the fire. Another is that a lot of trees have been struck by lightning - maybe the marker tree.

The best bet would be a winter search when a) vegetation is down and b) it would be cool enough to wear suitable protective clothing.

18-Aug-92 Tres Ninos

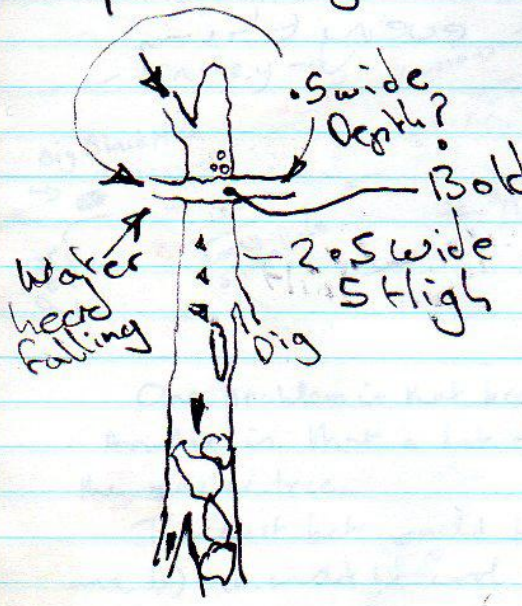

PT Eagar. Andy [illegible]gle, Surface Alan Jennings

Easy trip to last years limit ie:- one dig and a climb which needed bolting. 10min digging gained nothing a 1.5Ø alcove no way on but a slight draught, possibly from cracks in wall.

Climbed up in to sloping rift and bottom of climb. Spent 30min climbing only to find it clocked at the top, but with an excellent advantage point to see opposite end of rift, which had an opening in it.

Spent a while climbing up to wedged boulders where a ~~[illegible]~~ sling was used to climb two over hanging blocks. Ran out of rope at the entrance of an open rift. (20m Rope)

Open Passage

A quick look revealed and easy dig heading back, an easier way down to rig a ladder. A pit/rift which goes both ways, and an open passage across the rift 1.5 high 1 wide

We will return tommarow.

Quote

Andy:- by the way the rope doesn't reach the bottom

Peter:- now you tell me (Over halfway down).

Bolted all the ladder climbs on the way out

I am sick of going up and down glory must be around the corner.

PT Roger.

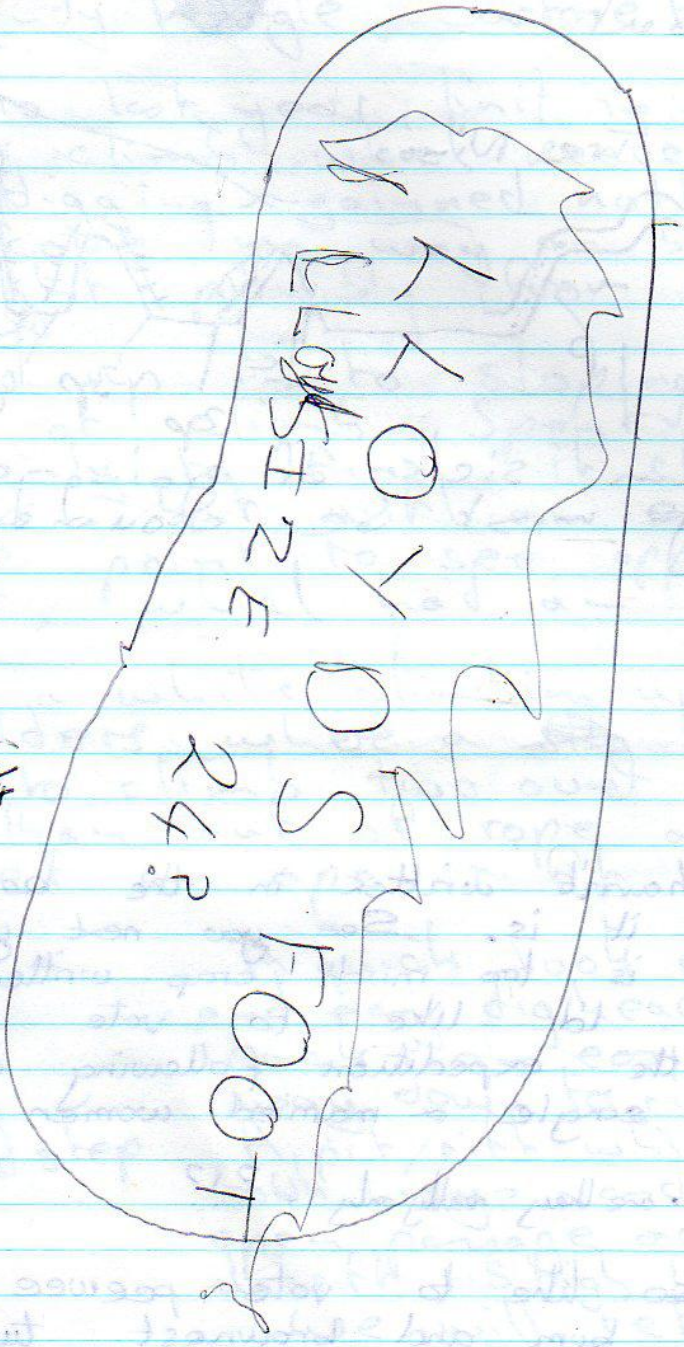

I haven't written in the book this year so here it is. See you next year. Love Sarah xxx. There is too much crap written in this logbook and I'd like to vote Steve 'O' hunk of the expedition following certain comments from single & married women plus 14 year olds.

Oh God!. are they really only 14 ?!?

I'd also like to vote peewee BOF with the cutest bum and brownest twiddley bits. Love you Poof!

(TOBY 3 Trips!)

Aug 18 Fresnado II Chris L. & Rich B.

Our final trip in through the mud bowl to try a climb and de-tackle the cave. Completed a 10m climb up a steep calcite flow in yet another un-named chamber (the one Tobey, Rich and Pedro all found via different routes). The hoped for route out the top was mud choked. Came out well loaded with ladders, digging tools and mud. Left Tobey's hand line in Big Chamber and ladder on first pitch to get to it.

There is still loads of things to push in all sections of the cave. A few of the things at the end section which only saw one trip are:

- a climb up a ~1m wide rift ~20m back from the final choke up Munsters Waltz - is drafting and will need bolting, has exposed start but is only one m wide once in it. ~15m high?
- a pitch to drop out of Henry Chamber back into the streamway - 10-20m?
- check loops of main stream after sandy crawl
- look for main draft after "dark sump" - lost in big passage possibly at ⌐ corner.
- push main river downstream - take lump hammer enter through boulders at big corner before main stream is encountered. probably wet

311

Aug ~~18~~ 20 TOBY, JANE, ANDY P. SARAH,

FOUND 311 quite easily. Good draught and the dig looked fairly easy. A few tackle bags of rocks were sent up to the surface & then we strolled around looking for other holes. Found a shaft that was estimated between 70' & 150' no draught. Sarah found a fence which was in the correct position for 309.

537

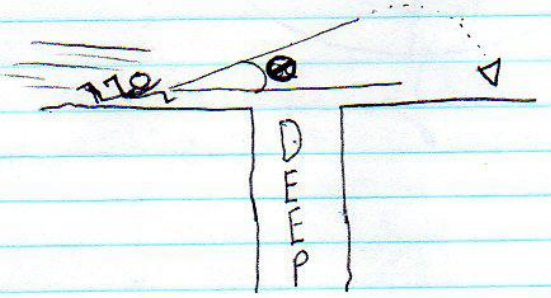

Aug 20 Toby, Jane, Sarah, Pete, Steve, AndyP, Ewan, Penny, Jenny. (27ish pm)

Dug 311 until it started digging itself. Dropped 90' pitch to choke. Dropped 309. Dropped new hole No 537 to choke. (20m) Dropped fenced hole 167 (new) & 476 (new) both no go. Found strongly draughting dig 495. This would take a bit of digging but could be well worth the effort.

Lots of people did lots of things that Bears do in the woods.

Aug 19th Steve O and Pete. Tres Nuros

Went straight to the point where Pete had stopped the day previously. After placing a bolt on the near side of the rift for physiological reasons only, took a 4m run up and leapt comfortably over the rift

Passage continues over the other side of rift until after 50ft another similar rift is encountered. This rift is easy to climb down for about

is yeek. Here the rift becomes v. narrow and is filled with boulders with a slight draught. NO GO.
Back to the junk rift - this was dropped for approx 60 ft and is still going down. Muddy but is likely source of draft.
Left several ropes in vital places (ie climbs and pitches) on the way outs. Plans to go back next year already lain.

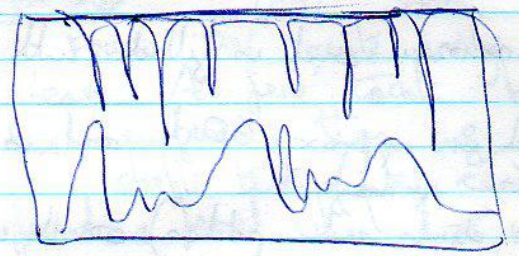

Steve O.

Risco 22nd August Bobby, Pedro

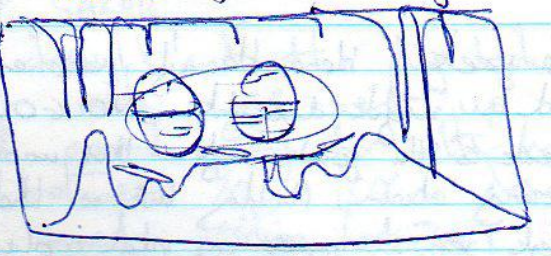

Entrance much improved, generally less rubbish and no hypodermics or dead animals. First we went up main stream passage as far as where Arco Gallery comes into it to have a look up at the roof - signs of something up there. Then went up into Arco Gallery (high-level), end of it could possibly be passed to potential passage across top, by climbing up on left, putting a bolt in and then dropping down a rope. On the way back we looked into two side passages on the left (going out) These had footprints along them but we managed to get into new chambers. See next page for graphic illustrations. Finally had a romp up the Pinto Gallery. Came out right on time, just as cars arrived to bring us back. General impression, there's still stuff to be found down there and it's really quite a nice cave.

"New bit in Risco"

Quote from Secretary of Pengelly Trust devoted to Cave Conservation:

It's O.K. Pete, I'll smash the ones you don't get

22/8/92

COTERON SEDIMENT SAMPLING TRIP

Well where do you start. Rugged pitches to Edge of the World and began to take samples behind. Quentin... if you bang on a tube 1m into a pile of sand how much sand do you get?

$$x = \frac{\pi \times 3^2 \approx 3^2}{\frac{3}{3} \times 2 \approx 2} = 1 \text{ metre.}$$

NO WRONG

you get approx 30 ~~cm~~ cm of sediment. Eh um oh well lets do another one..... 1m in and .... O sediment shit lets try another. 2hrs later and 30cm cave .... Oh sod it

Tried to find Peredo arm - lost it - left cave - went to Snows ... came home. Wonderful Day.

Steve O. (Camp Commandant).

16th August - Riolastras, Toby, Pedro

1. Shaft (Torca del Avellano) fenced off in middle of field, so easily spotted Estimated 50 ft, moderately interesting - grid reference estimated from 1:25,000 map 56220305 Alt. 240m (544)
2. Cave, small entrance under a rock, although farmer said they come from all over the world to do it, it wasn't very good - ~~about~~ 15m to a crawl, no draught 56630338 Alt. 220m (554)
3. Shaft, on edge of field, just over fence, estimated 10m, not very promising 55700275 Alt. 200m. (555)
4. Shaft, with hazel tree on edge of eucalyptus wood, estimated 25ft. - farmer described this as a draughting cave! 55450242 Alt. 240m. (556)
5. Bar - very pleasant, unfortunately outside our area, although the road is inside.

My last NIGHT Who's Going To F*#$ THIS PAGE?

23/8/92 Pedro, Jane, Toby. FRESNADO II

The day after Juan + Penny gave us lots of nice food, wine, Anais and the Nunwicks arrived so we took his tent down and made him go to the bar.

Rampant hangovers led to a 3pm start. Ropes taken out from big chamber. The ladder was removed from the climb into known Passage and a pull back line placed here. THE ROPE IS DOUBLED THROUGH THE HANGER AND, IF USED FOR A HANDLINE, MUST NOT BE LOADED ON ONLY ONE SIDE. Pedro pushed a crawl in cascade streamway for 20m to a draughting stal dig. An inlet was looked at in the chamber before the traverse (going out of the cave) a short climb needs 2 boulders moving before access can be made into an ascending passage with a draught + echo.

Continuing out of the cave a short dig at the start of the Traverse led into a high rift chamber with passages visible in the roof 20m up mud. A climb at the far end became too slippery before any conclusion was reached. A 15' ladder pitch in the floor led to an immature stream passage too tight both ways. The draught going into the chamber all seems to go upwards (*)

On the outside of the traverse a mud choked passage in the R. wall takes a good draught + needs digging.

* Just before One Footprint Passage a passage on the R. takes some draught and needs 2 calcited boulders hammering to make further progress.

*On the way out. The aven on the boulder choke side of one Footprint Passage was climbed by Pedro last year and ended in boulders with a passage visible beyond. This also needs doing

(*) Another dig next to the one which went to the chamber has a draught coming out. Pushed for 5m in a tight passage with a mud floor that could be dug. (and should be!)

Mick left early today saying he was going before anyone else did anything nasty to him. We only got him drunk!
